21st report.

PUBLIC LIBRARY
OF THE
CITY OF BOSTON

Office of the Board of Fire Commissioners,
Old Court-House, Boston, February 1, 1894.

Hon. Nathan Matthews, Jr.,
Mayor of the City of Boston:

Sir: The Fire Commissioners herewith respectfully submit their twenty-first annual report of the work done by this department for the year ending January 31, together with certain recommendations looking to the extension and larger efficiency of the service.

Alarms and Losses.

The department year has been a very busy one. The resources available for the extinguishment of fires have been severely taxed, and the necessity of substantially strengthening them has been emphasized. There have been 1,718 alarms, an increase of 306 over the year previous, and considerably more than double the annual average eight and nine years ago. This means more than a twofold increase in actual fire duty as compared with a few years ago, and a corresponding increase in the work of administering the economic and disciplinary affairs of the department. The losses on buildings and contents amount to $4,348,902, the lion's share of which is due to the conflagration of March 10, on Lincoln street and vicinity, whose sudden and sweeping character and large proportions are vividly remembered, as should also be the lessons and warnings as to building construction and arrangement that were written in such glowing characters by that event.

Standing of the Department.

The story of department enlargement is a very short one. There is little to add in this respect to what was stated in last year's report. The new headquarters are very near completion, and will soon be ready for occupancy by the Commissioners and Chief at least, and in the course of a few months it is hoped to install therein a new fire-alarm plant that shall embody the latest and best features in this important branch of fire-service. Quite a handsome house at Ashmont will soon be ready for apparatus, and help to fill a gap in the fire protection of that section that is now alto-

gether too large. No advance has been made toward the location and construction of a horse sanitarium, and the city is still paying rent for quarters that are far from satisfactory for this particular purpose. An appropriation of $50,000 has been made for a new fire-boat, and the commissioners have set about securing the necessary plans and specifications to give this sum practical utility as soon as possible. This piece of apparatus will constitute, when completed, a very valuable reënforcement.

There is a great deal that needs to be done at the present time for the better protection of the city. The Boston and Maine system of railroads has already added sufficient hazard in Charlestown to make necessary another engine company somewhere in the vicinity of Prison Point, and the risk there is constantly increasing. An engine is needed somewhere near Day street, in Roxbury. At Grove Hall the city has for several years owned a site for a ladder and chemical engine house, but there is no money to proceed with the work. Chemical engines are needed in West Roxbury, Dorchester, and East Boston. A beginning has been made toward rebuilding the house of Ladder 1, but there is the same need for replacing the house of Ladder 13 with a new one. The sum of $300,000 could be expended at the present time for new houses and apparatus without exceeding in the slightest the legitimate needs of the department.

There are two matters of a very practical nature now before the City Council, of which the Board would ask very careful consideration. One is a request to petition the Legislature for authority to cause buildings of a certain class to be equipped with metallic ladders and stand-pipes, the same as in certain Western cities, where their value has been demonstrated many times over. The other is the proposition to run 12-inch pipes into the conflagration district from the harbor, for which the fire boat or boats will supply the power. The Board has made no suggestions that promise more protection for less money than these, and the sooner these systems are established the better it will be for all most deeply interested. Boston is behind even some of her smaller sister cities in these important respects.

Since the reorganization of the department, twenty years ago, there has been no rearrangement of the fire districts except in some slight details. The number has not been increased, and it must be evident to all that with the great growth of Boston during that time, the old system has become unwieldy in some of its parts, and not as convenient as it should be in its operations. For instance, District 10 includes half the territory of the city, and District 8 is not

well arranged for the best service of a single chief. This matter has been the subject of frequent discussion by the Commissioners, and only lack of means has prevented them from making the changes which their judgment has so strongly urged.

APPARATUS, EQUIPMENT, ETC.

The department is not relatively as strong in apparatus as it was a year and a half ago. It is sound policy on the part of business concerns employing machinery to charge a certain considerable percentage each year to depreciation; and, certainly, a fire department, which has at times to give its machinery exceptionally hard usage, cannot be exempt from this rule. No apparatus, in the strict sense of the term, has been purchased for about a year and a half; and, although the repair-shop has kept the present supply in good working condition, a yearly addition is necessary to prevent the department from falling behind. There are needed at the present time three new first-size steam-engines, an aerial ladder truck, a chemical engine, etc. What could be done at comparatively small expense to help the material part of the service has been done. More three-horse hitches have been put in, and, where practicable, two-horse hitches have been placed on the down-town hose wagons, thus enabling the companies to carry a larger amount of hose. A water-tower attachment has been made to each of the aerial ladders, and a few coal and hose wagons have been purchased. A wrecking wagon has been ordered, which will be a unique but valuable feature of the service.

CONSTITUTION OF THE FORCE.

The men employed in various capacities to run the department number a trifle over 800. Of these, about 600 are permanent firemen and 120 call men. The complaints that come from some sections of weakness in the companies appointed to protect their property can never be measurably satisfied until we have permanency throughout. The Commissioners dislike to renew their annual protest against a continuance of the call system, but they consider it their duty to do so, knowing that it is out of place and an element of weakness in a large city department. As has been said before, the call men are all right, but the call system is all wrong, at least for Boston. The drill and engine schools have done good work, and a high degree of discipline and efficiency prevails throughout the force.

Inspection of Wires.

The work of this bureau is given in detail elsewhere, and shows a busy record for the year. Legislation is now in process which promises to relieve the city in a few years of the incubus of the overhead system of wires; and, certainly, nothing can be done that will be more welcome to this department. The wires have been among the most serious obstacles against which it has had to contend, and, to a greater extent than is known, the cause of many of the battles it has had to wage.

Horses.

The city owns 237 horses, and has in extra service, for winter use, 60 more. During the year, 37 new horses were purchased, 23 sold or exchanged, 5 died, of which 2 were killed. The number of horses receiving treatment was 185, resulting in 350 cases, of which 150 were treated at the Horse Infirmary, and 15 were horses received for extra service. The horses of the department have been, and are, in generally excellent condition. During the year a horse-shoeing shop has been established at the Infirmary, and considerable work has been and is being done there.

The Department Allies.

The Board desires to thank the police for their cordial and efficient assistance. It has been the policy the past year to extend the fire-lines more than formerly, thus making their duties somewhat more exacting; but they have acted well up to the measure of their responsibility. The Fire Marshal's office has made a good record, and proved again its value as a coöperative bureau; and the Protective Department has shown its usual promptness and efficiency.

The Board of Fire Commissioners

consists of three members. One member is appointed annually, for a term of three years from the first Monday in May each year. The nomination is made by the Mayor, subject to confirmation by the Board of Aldermen.

Robert G. Fitch, *Chairman*, for three years from May, 1892. Term expires May, 1895.

John R. Murphy, for three years from May, 1891. Term expires May, 1894.

GEORGE H. INNIS, for three years from May, 1893. Term expires May, 1896.

Salaries, $3,500 each.

Benjamin F. Underhill, Jr., *Clerk*. Appointed by the Fire Commissioners. Salary, $2,400.

FIRE DISTRICTS.

The city is divided into ten fire districts, as follows:

DISTRICT 1. — Comprises all that part of Boston known as East Boston.

DISTRICT 2. — All that part of Boston formerly known as Charlestown.

DISTRICT 3. — All that part east of a line beginning at the Charles-river drawbridge, and running through the centre of Charlestown street, Haymarket square, and Washington to Summer street, and north of Summer street and the N.Y. & N.E. R.R. passenger depot to the water.

DISTRICT 4. — All that part west of District 3, and north of a line running through the centre of Winter and Park streets, and west of Beacon, to Arlington street, west side of Commonwealth avenue, to Chester Park, to water.

DISTRICT 5. — All that part south of Districts 3 and 4 to the centre of Dover-street drawbridge, and a line running through the centre of Dover, Berkeley, Boylston, east side of Commonwealth avenue, to Arlington, to Boylston street.

District 6. — All that part of Boston known as South Boston, and divided from District No. 9 by Locust and Dorset streets.

District 7. — All that part of Boston south of District 5, through the centre of Dover street, to the drawbridge; thence by water to the centre of East Chester park; thence through the centre of Albany and Northampton streets, Columbus avenue, West Chester park to east side of Commonwealth avenue to centre of Berkeley and Dover streets to the point of starting.

District 8. — All that part south and west of District 7 to the boundary line of West Roxbury, and west of Washington street to the Brookline boundary line, and including all of Ward 25, formerly Brighton.

District 9. — All that part south of Districts 6 and 7 to West Roxbury line, running through the centre of Seaver street, Blue Hill avenue, Columbia, Geneva avenue, Olney, Bowdoin, Hancock, Freeport streets, to corner of Dorchester avenue, thence due east to the water.

District 10. — All the southerly part of Boston south of Districts 8 and 9, including West Roxbury.

ASSIGNMENT OF DISTRICTS.

Each district is placed under the charge of a District Chief, as follows:

District.	Chief in Command.	Companies in District.			
		Engines.	Chemical Engines.	Hook and Ladder.	Hose.
1	John F. Egan	5, *9, 11, 40	7	2	. . . . .
2	C. H. W. Pope	27, 32, 36	9	*9	3
3	Lewis P. Abbott	8, *25, 31	. . . . .	8, 14	. . . . .
4	Wm. T. Cheswell	Tower 1, *4, 6, 10	1	1	8
5	John W. Regan	7, *26, 35	2	17	. . . . .
6	John A. Mullen	*1, 2, 15, 38, 39, 43	C.W. 2, 8	5	. . . . .
7	Patrick E. Keyes	*3, 22, 23, 33, Tower 2	. . . . .	3, 13, 15	5
8	Edward H. Sawyer . . .	13, 14, 29, 34, 37, 41	3, 6	11, 12	*7
9	Williston A. Gaylord . .	12, 17, 21, 24, 42	5, 10	*4, 7	. . . . .
10	J. Foster Hewins	16, *18, 19, 20, 28, 30	C. W. 1	6, 10, 16	. . . . .

* Headquarters of District Chief.

WATER AND HYDRANTS.

The total number of hydrants in the city February 1 was 6,373. In addition to these hydrants there are 238 fire reservoirs in different sections of the city that contain from 300 to 500 hogsheads of water, and can be used in an emergency.

The number of hydrants established and abandoned during the year is as follows:

	Established.					Abandoned.					Net Increase.
	Lowry.	Post.	Boston Lowry.	Boston.	Total.	Lowry.	Post.	Boston Lowry.	Boston.	Total.	
Boston (City Proper)	20	20	2	. .	42	2	1	4	8	15	27

Respectfully submitted,

Robert G. Fitch,
John R. Murphy,
George H. Innis,
Fire Commissioners.

APPENDIX.

The following tables show the location of the several pieces of apparatus in service or reserved, together with the name of the builder and when put in service; also a statement of the hydrants and reservoirs in use, the reports of Commissioner John R. Murphy on Foreign Fire-service, and the City Engineer on Tests of Engines, and the fires and alarms from February 1, 1893, to February 1, 1894:

STEAM FIRE-ENGINE COMPANIES.

REPORT OF COMMISSIONER JOHN R. MURPHY ON FOREIGN FIRE-SERVICE.

JULY 30, 1893.

To the Board of Fire Commissioners:

GENTLEMEN: In accordance with a vote passed by you, I submit the following report in reference to the fire departments and fire methods of the cities of London and Paris:

I spent two weeks inspecting London's fire department, most of the time, with the exception of one day, unofficially.

London has a population of about 4,250,000, and an area of 120 square miles. The Thames river, flowing through the city, although subject to considerable tide, makes a very valuable aid in case of fire. The streets are broad in the newer parts of the city. In the old city they are narrow. The buildings are so low and small in area that they do not present great difficulties in case of fire.

The water-service is supplied by some eight private companies which, by act of Parliament, furnish water for fire purposes.

The government of the city is complex. The old city of London, which comprises about a mile of territory, has a government of its own, with authority fixed by Parliament. The County Council, so called, governs the whole city (120 square miles) on certain questions of a metropolitan nature, under a special act of Parliament. In addition they have governing boards, which they call vestries, some forty in number, that look after the local affairs of sections which would correspond to wards in an American city. Questions such as streets, lights, local sewers, and such matters come under their care. The fire department being a general rather than a local question, comes under the London County Council, and is governed by that body through a committee in the same way as the American fire departments were managed twenty years ago.

The department consists of over 800 men, about 50 land steam fire-engines, 9 steam fire-engines on barges, used in river service, 9 large ladders, quite a number of hand-engines and hose-carts, most of which are in the same stations as the steam fire-engines, and 179 single ladders at fire-escape stations. The above includes men and apparatus in active service. These facts I obtained from one of the principal officers of the department, except that he said there were 155 fire-escape stations, while their annual report calls for 179.

The ladder service consists of the 179 ladders which are at the fire-escape stations, some 7 fire ladders, each of which has one end on two wheels and the other end tied on ordinary four-wheeled carts, and 2 extension American ladders. Some, if not all, of these ladders are placed in sheds in the rear of the stations, and are not equipped for immediate service. The houses in which the men and apparatus are quartered are in excellent condition, and compare more than favorably with the houses of an American department. Glazed brick, which costs with us from $120 to $130 per thousand, is used on the interior, and most of the houses that I personally inspected could be justly entitled luxurious in their appointments and appearance. The cost of their new fire stations alone averages about $40,000. As the price of building is low in London, that would be equal to from $60,000 to $80,000 with us.

The number of men attached to a company is 12. The fire-escape stations are covered by details from the nearest company. Most, if not all, of these fire-escape stations have each a detail at night of from one to three men. In the daytime the greater part of them have no firemen present, and the ladder is wheeled to one side in the nearest convenient place where it can be stored, generally the yard of some public building. The ladders are mounted on two wheels and stand upright from them. They appear to be about forty feet in length when extended, and are wheeled to the fire by hand. The public are supposed to assist if needed, and an allowance of 1s. is made to each of two citizens aiding, and of 1s. 6d. to a third citizen, provided he also gave the alarm. Most of these fire-escape stations have no connection with headquarters either by telephone or telegraph. In order to reach them a special messenger has to be sent.

In each engine-house they receive alarms from what they call 8 to 11 "points," or what we would call fire-boxes. The boxes are small, with a glass front. In most cases they are without any sign or any way of alarming the public, to prevent a false alarm being sent in. You break the glass, and a knob with "pull" on it is there for you to give the alarm. Pulling the knob drops a disk similar to an annunciator in the nearest engine-house.

The *modus operandi* at the station is as follows: Officer in charge is notified of an alarm by man on patrol, and he rings for the men. If at night, they are sleeping (in the houses that I examined) on the third and fourth stories, a hundred feet or more in the rear. They jump out of bed, pull on their trousers, and in their stocking feet run down long corridors, come down the long flights of stairs to the

floor (in some cases going to separate buildings for the horses from that where the engine is stationed), take off the halters, take down the harnesses, put them on, place the bits in the horses' mouths, run out holding them by the heads and hitch them up.

The water in the boiler of the engine is kept warm by gas conveyed to the fire-box by rubber hose. They unhitch the hose from the door of the fire-box, put in the shavings and wood, take a match and light it. The men go to racks upon the walls where their clothing is hanging, take their leather boots and pull them on, then put on their coats, buckle their belts, containing a small hatchet and other implements, round their bodies, place their helmets on their heads, and then take their positions on the apparatus. The engine is a hose-wagon and engine combined, so that when the engine comes to a fire it is in the form of one piece of apparatus. The time of hitching up in the house at night, I was informed, was from three to four minutes. I saw in the headquarters of the service a hitch-up made, with the men on the floor dressed, boots, helmets, all complete, with a hand-engine, where they had no trouble in the way of firing the boiler and harnessing the horses. This was practically what Americans would call a floor hitch, and the time was over 35 seconds. A floor hitch in an American house can be made under far less favorable circumstances in from 2 to 6 seconds; a night hitch, with the men in bed, in less than 20 seconds.

English methods of getting apparatus to work at a fire are so slow that one does not ask how many minutes it takes before a company is at work, but what portion of an hour. American departments can best understand their slowness when they call to mind the fact that in every American city that claims to have a first-class department, an alarm from its dangerous boxes means that a company will arrive there with its engine in working order, and get its men inside the building, playing water on the fire, in less time than a London engine takes to hitch up. After the apparatus leaves the house it goes with considerable speed to the fire. Before leaving the house, however, the officer telephones the superintendent of the district, corresponding to the district chief with us, where he is going, and the superintendent telephones to have a second engine from his district follow the first. When the engines arrive at the fire, if more are wanted, a man is sent on horseback to the nearest fire station, which may be a mile away, and he telephones to the district superintendent how many more engines are wanted, and more engines are sent from time to time, as called for

by telephone, each time the man going back on horseback to convey the order of his superior officer. If the fire is of such magnitude as to exhaust the engines of one district, then headquarters, when telephoned, sends more from the next district, and so on until the engines of the whole city are at the fire.

Some of the engines have the doors of the fire-boxes in the front part of the boiler, so that the engineman cannot reach them when responding to an alarm. Fully one-half, I should judge, of the entire London service is this way. The result is that, after they leave the house, it is impossible to feed the fire and get up steam on the way, and the engine, if going any distance, would, under these circumstances, arrive frequently at the fire without being in a condition to get to work immediately.

The hand-engines are sent to alarms of fire from the nearest boxes to the engine station. To boxes at a distance, or when it is known that there is a fire in progress, steam-engines are sent.

When the engine arrives at a fire it is attached to a hydrant in the following way: a pipe about two inches in diameter is screwed on to the hydrant, a piece of hose is screwed on to that and run into what they call a fire-dam or canvas box, which has to be set up. The water is let into the canvas box, and from this the engine runs its suction and draws its supply of water. At the fires I attended, one hydrant and one canvas box supplied one engine. In the meantime some of the men take the hose, which is in separate lengths and rolled up like a coil of ribbon. One man couples a length to the engine and runs with the end, then another man runs with a coil and couples it on to that and runs with it toward the fire, then the first comes with another coil and couples it on. This peculiar way of running a line is kept up until the requisite length of hose to reach the fire is obtained. The pipe is then screwed on, and, if the engine has sufficient steam, the company is ready for action.

The hose couplings are two inches, the streams played from hydrants a half-inch, and the streams played by engines on land three-quarter inch. I was informed that they also used inch streams, but I did not see any nozzles of that size on the engines, neither did I see any in use at any of the fires I attended. Before an engine can get its supply of water it very often has to be turned on by an employee of the water service. If he is not there, he is either sent for or the firemen have appliances with which to turn it on.

The smallness of the engines especially struck me. All their engines are single pump with small boilers, and a very few of them, about six, deliver a gallon and a half per

stroke. The balance is divided between engines that deliver about a gallon and a gallon and a quarter. They are tested when purchased on the basis of 150 revolutions per minute, and their maximum and minimum according to the condition and age of the steamer is 120 and 90 revolutions. On the basis of 120 revolutions the maximum capacity of their engines is 120, 150, and 180 gallons per minute respectively.

If ladders are needed at a fire they have to depend upon the small ladder carried by the steamer, which would not reach some of our second stories, or the ladder which comes from the fire-patrol station if the alarm was given from there. If more are needed they have to send to the nearest station a special messenger and have them come by hand. If the longer ladders are wanted they are brought by horses.

In one of the engine stations I saw the method of conveying one of their long ladders. One end of the ladder is on two wheels, the other end is tied on a four-wheeled team which they call a van. If needed at a fire it is called by telephone, and the engine-horses are hitched to the van and they draw it there. I said to the man on duty, "If your horses draw this ladder to a fire, and the engine is wanted, what do you do?" He said, "We can't take it; we would have to fall back on a hand-hose cart." In other words, the ladders are brought to fires by hand, except the nine large ones, which are brought by horses when specially sent for by messenger.

What they call a large ladder is about equal to one of our Bangor ladders, which we carry on our ladder trucks. Their way of carrying large ladders, while not quite so difficult as the carrying of ship-masts through the streets, is almost as cumbersome. It is impossible to convey the London ladders with that celerity which is essential in case of fire.

The men of the London brigade are recruited from sailors. Twenty or thirty years ago, before the ocean steamship developed to such an extent, there might have been more grounds for this than there are to-day. Sailors on steamships are not sailors of the generations that have passed, and while it may be good judgment to have a proportion of the service sailors, it is not, in my opinion, good policy to have it so exclusively. The fireman in a modern city should not only have ability to climb, to handle ropes, as the old-time sailor, but should combine with that a mechanical ability which would make him familiar with buildings and their construction, and, as a climax, he should be possessed of the requisite daring and judgment to make of him what may be justly called a modern fireman. The men of the

London service struck me as being strong, rugged, and possessed of most of the requisites which make a fireman, but, by training, they have no knowledge of building construction. This is an essential weakness. The physical and mental examinations which they go through are not so stringent as in Boston; neither is their drill-school so well developed in its methods.

The pay is 24s. ($5.76) a week when they first enter, with slight increases for the first few years. After that, in order to reach the maximum of pay, 37s. 6d. ($9) a week, they have to await vacancies and take the raise of pay in the order of seniority. It takes about fourteen years to reach the highest grade, and a fireman must serve twenty-eight years before he is entitled to a pension. Out of his salary the fireman pays a small sum for his quarters in the engine-house.

A curious fact connected with the service is the large number of changes that take place yearly. In the last year 96 men out of a total of 825 left the service, and of this number 53 resigned. There is but one deduction from this extraordinary state of affairs, and it is that it comes either because of the peculiar roving disposition of the sailors that compose the service, or the small pay and the long service necessary in order to obtain the high pay. A service which changes like this cannot get the best results. It must be lacking in well-trained and experienced men.

The engines of the service are too small in their capacity. While they meet the ordinary demands, when an extraordinary demand comes they are not sufficiently large in water-throwing capacity. It is pretty much the same as though an army had all light guns and none of heavy calibre. The reason given for the use of such engines is a desire to get quickly to a fire. Yet in their hitching and going to a fire they lose many minutes. In their methods after getting to a fire there is so much time wasted that it strikes an American very unfavorably.

This extreme smallness of engines is all the more remarkable when I saw engines of English make, of double the capacity, and even more, of the London engine, on exhibition by makers and in service in other English cities, the weight of which was not much greater than that of the London brigade engines. London should send most of the engines that she has now to the outskirts, and in the five or six congested centres of that great city use engines of large water-throwing capacity and light in weight.

The horses of the service are splendid animals. This is to be expected in a horse country like England. They are hired, not owned, by the service.

The water service seemed to me to be sadly lacking in many respects. It should be owned by the people for the public benefit, not by private corporations for private gain. The system, to say the least, is peculiar. In many parts of London they have what they call "intermittent supplies;" that is, the water is let on at a certain hour in the morning. For domestic purposes people fill the tanks in their houses, and then the water is shut off. The same rule of shutting off, except when needed, applies to water for fire service, and cases have occurred where engines have responded to fires and have been unable to get water, owing to the fact that the man to turn on the water was not present. A system of this kind means, even if the water is turned on either by a representative of the water department or a fireman, delays of a dangerous nature. The hydrants are used also by men who are not connected with the water department. The use of them should be restricted under the supervision of the fire service and the water companies. The smallness of the hydrants, which furnish only about a two-inch water supply, struck me unfavorably. The number of hydrants, when we consider the area of the city and its population and the fact that one engine alone can connect to a hydrant, is extraordinarily small, and the result is that the engines cannot be massed sufficiently close to a fire to render full and efficient service. Their hydrants should be more numerous, and, like ours, post hydrants or their equivalent, so that four engines could be supplied from a hydrant instead of one. The canvas box should be done away with, and the engine suction connected direct to hydrant.

The hose is without jacket and lined with white rubber, which rubber dealers tell us is the weakest kind. The couplings are fastened by an old process long obsolete in America. Instead of using 2-inch couplings they should use at least 2½-inch, if not larger, and increase the size of their hose. Their method of running off a line of hose at a fire by coupling each piece after they arrive there, is behind the times. They should have their line all ready to pull off at a moment's notice, and all coupled, just as it is in an American service. Their system of combining hose and engine in one piece of apparatus could be, perhaps, economically used in the suburban parts of an American city, but in the heart of their city, as well as in Boston, the correct system is the engine and hose to be carried on separate pieces of apparatus. The size of their streams is too small for large fires. Their hand-engines are relics of barbarism. They do not use chemical engines as in America, yet they need them far more than we do.

Their fire-alarm boxes should all have signs telling how to work them, and when the glass is broken a bell should ring, as on our keyless doors. I think that would prevent many false alarms. Out of about 4,164 alarms of fire in one year, 1,029 were false — an extraordinary record, which can only be accounted for in part by the fact that in giving an alarm there is no way of notifying the police or public when a citizen is sending it in.

Their system of sending apparatus to the fire is slow and complex. It is impossible for them to mass their service quickly in case of great need, either wholly or in part. The American system, which makes it possible to notify the whole service within a few minutes, if necessary, is as superior to theirs as day is to night.

Their fire-escape stations with the men on duty at night should be covered in the day also, and so situated that all could be communicated with at once and notified other than by messenger if they are wanted. Either this should be done or the peculiar system as it now exists, which fritters away the strength of the department on unconnected bodies of men, should be abolished. If this is army discipline, it is a violation of the rules of warfare, which never allow, where it is possible to prevent, any portion of the army to have its communication cut off from the main body, its base of supplies.

Fires sometimes are large and travel fast in London, and the occasion has arisen, and will arise again, when the services of all her men will be needed quickly; yet it is impossible, under the present system, to obtain the whole service at once if wanted.

The average number of boxes per square mile in London is about four, so that, in order to give an alarm, it is necessary, in many cases, to run a long distance. Boston, with one-ninth the population, and a little over one-fourth the area, has as many fire-alarm boxes in service as has London. The boxes should be thicker in London, owing to the density of its population, and people should not be compelled to run so far in order to send in an alarm, and thus lose valuable time.

I investigated the question of patrolling the streets, and I found that the London brigade do no such thing. Statements have been publicly made in Boston that in London every fireman would be required to be familiar with every building in his district. This is not the fact. The firemen know nothing about the buildings; neither do their officers. In this respect the London service could take pattern from an American department, where, in accordance with rules which

they reduce to practice, the officers do understand, as far as in a human being lies, the construction of the buildings in their city. It is only fair, however, to say of the London service that their building construction is, in the main, of such a nature that the enforcement of a rule of that kind is not so necessary as it is in Boston.

The ladder service of the London brigade is not abreast of their steamer service. It is true that their fires, owing to good construction, in many cases do not travel fast. This gives many chances to put them out by inside fighting. Yet they have plenty of fires where it is necessary to get at the fire by ladders from the outside, and as their fire ladders are not run by horses, valuable time is frequently lost in scientifically attacking the fire. In conversation with fire authorities in London, I was informed that they could accomplish all they desired from the ground. A statement of this kind shows the utter lack of knowledge of ladder service possessed by foreign fire departments. London needs a first-class ladder service. Because of the lowness of its buildings there is not so much necessity for the heavy service of an American city; yet one modelled on the American principle, which embraces separate companies with ladders and apparatus for ladder duty only, and with the men and apparatus drawn by horses to fires, would increase to a wonderful extent the efficiency of the London brigade.

One hears a great deal more about saving life than about the amount of property lost in foreign fire services. A life saved receives more attention in the columns of the press than a fire that involves large loss. It is a feeling that is to be admired. I gave special attention to this branch of the service. I found in London 179 ladder fire-escape stations to 120 square miles of territory, or over one ladder to the square mile. In case a ladder was needed, that would make it necessary at times to run a mile or over to notify the fire-escape station, and then to have the ladder run back by hand all that distance. This is a vital error. The ladders should be situated so as to be called electrically, and thus save an enormous waste of time. Many of the ladders are equipped with a chute, down which the people to be saved are supposed to be sent. I question the usefulness of these chutes. It requires more men to handle them quickly than are attached to the ladders. I noticed that some of the latest ladders placed in service were without these chutes, and, on inquiry, was informed that none of the new ladders were equipped with them. Possibly the service of chutes is being done away with. If they are, it is good judgment.

For jumping-nets they have some made of canvas, such

as the American fire departments have discarded. The pompier ladder service and the use of ropes in connection with life-belts, for saving life, as practised in our Boston service, is unknown, although very essential in case of emergency. I saw no guns for shooting life-lines; neither are the men drilled after the American life-saving system. I have no hesitation in saying that the American ladder service, both for fire and for life-saving, is immeasurably superior to the system in vogue in London.

I was present at some fires in London and saw the department at work. The crowds congregate around the engines close to the fire more so than in an American city. I watched the methods of the department and failed to see, either in discipline or so-called scientific fire-fighting, where they equal the fire department of a large American city.

Siamesing is not practised to any extent. They have some simple two-way siamese, but I did not see them in actual work. They try to reach the inside of a building at a fire, the same as our firemen. They also attack from the street at various points; but, unlike our firemen, they are not able, by means of an excellent ladder service, water-towers, engines with large streams and three-way and four-way siamese, to direct their streams of water so as to go straight in in heavy volumes through the windows and openings, and strike at the heart of the fire. Streams directed from the street must necessarily lose much of their efficiency when they enter in a slanting direction.

It would appear that the London department does not bother itself very much about science, for I was informed that they had lately tried hose unlined, which, for actual fire duty, is little better than no hose at all. All the fire departments from other cities outside of London that I met, without an exception, use hose unlined, which shows that scientific fire-fighting does not enter largely into the English fire departments.

Regarding the discipline of the London service, there is nothing to make it superior in this respect to an American service. It may compare favorably, and no more. As in any large body of men, whether a fire service or an army, black sheep can be found, and men will take their chances of being caught in violation of the rules. A soldier on guard in the face of an enemy will desert his post for a short time, even when he knows the penalty is death. London has her share of delinquents.

I saw many things which, accustomed to the strictness of an American service, surprised me in London. I suppose they are allowable according to their rules. In some of the

houses I saw the captain standing at the door on the main floor of the house, partly in uniform, smoking a pipe, with the men in groups lounging around doing the same. Sometimes little children of two or three years of age would be seen playing around the engine. A happy family picture, yet hardly in accordance with strict discipline. I spoke to one of the members of the service in regard to this particular fact, and he seemed to take it as a matter of course. His reply was, "Why shouldn't we do it? The engine-house is our home." I believe that, in the matter of discipline, more is demanded and received in an American department than in an English service.

The system of utilizing the Thames river for fire-fighting purposes is by having engines on barges, and towing the barges with steam-tugs. It is not so good as the American system of having steamer and tug combined in what we call a fireboat. Such good results are not obtainable either in quick manœuvring or general efficiency at a fire.

London needs sliding-poles for its engine-houses, hanging harnesses, horses educated to run out at an alarm, an electrical system of sending in alarms which notify the whole service, two ways of sending them out, as in America, so that if one misses the second will not; an increased number of men in her companies, as, owing to details, a company frequently goes to a fire with only a few men. In short, she should adopt American fire-department methods more fully than she has.

From England we can learn much in the way of prevention of fires. In London, Liverpool, and in other large English cities which I visited, I saw no poles or electric wires of any kind in the streets. Everything was underground, and this is a remarkable evidence of the commonsense of the people, when we consider that in London alone over 40 different local governments have charge of the streets in matters of this kind. Their reasons for not allowing wires or poles on the streets are: First, danger from fire; next, because it spoiled the beauty of the streets. Quite a number of wires are run over the house-tops, not as with us on heavy, wooden, inflammable structures, but on small iron posts with cross-arms of the same metal, some of them carrying more than a hundred wires. The wires underground are in many cases laid in shallow iron trenches, placed under the sidewalk about a foot below the surface, and the results from having the wires underground have been successful in the extreme. Seven years ago, during a storm, the wires of the whole London fire service were blown down, and they were without any fire alarm for some time. Immediately after

that the post-office authorities allowed the fire department the use of their underground wires, and the result has been little or no expense in their maintenance and far better results in service. Before the London County Council the question of subways for the general use of underground wires of all kinds is under consideration, and subways are partly in use, from which the city receives rent.

The number of police on duty in London as compared with Boston is very large, and is an excellent provision, not only from a police, but from a fire, standpoint. In old London, about a square mile in territory, there are a thousand police; that is, more on duty in one mile than in the whole of Boston — 37½ square miles. The balance of the city, together with portions of the country, including territory 15 miles each side of Charing Cross as a centre, is covered by the metropolitan police, 15,000 to 16,000 in number. They come under the jurisdiction of the Home Secretary. A small portion of the metropolitan police look after the dockyards at Chatham and elsewhere.

The benefit to be derived from their system of a numerous police service is that the streets are thoroughly patrolled, and if the police do their duty the chances of a fire being discovered in its earlier stages are greater with a large number of police than with a small number. Of course, a fire may be burning in a building at night for a considerable length of time, and the smoke be drawn up by way of the roof through elevator shafts or other openings, and not be discovered even by the utmost vigilance of the police service until the building is all afire. These conditions exist in London, but in a modified form as compared with an American city. There is no doubt that the thorough patrolling of a city, especially at night, prevents large fires by giving early alarms. Boston, which, like every other American city, needs to have its fires discovered and the department notified at once, is behind London in this respect.

One never ceases admiring the building construction of London from a fire standpoint. Wooden buildings are unknown, and wood enters into the interior construction to a small degree as compared with our American buildings. The roofs are of tile, slate, or metal, and are so constructed as to be easy of access from one building to another. Shingle and inflammable roofs such as we have would be a curiosity.

Elevators are not used largely, neither are boilers for the purpose of giving steam-heat. The result is that the buildings are not cut up with elevator-shafts and openings for running steam-pipes; neither are the insides of the buildings

in winter, by the use of steam, dried in such a way by excessive heat as to make them easy food for fire. How different is it in all these particulars in America! High buildings make elevators necessary; the excessive cold of winter necessitates the use of steam-heat and fire of all kinds to such a degree that the interior of the buildings, being mostly of wood, are dried; and as we lack that moisture and evenness of climate which seem to be a feature of London, our liabilities to fire are greater than theirs, even if we were on equal terms with them in building construction.

I talked with insurance men, and, in speaking of the merits of an American city and London from a fire standpoint, they said it was a mere matter of construction. The buildings are low and small in area, and the monumental effects which we get in some of our buildings are unknown. The only criticism I heard of the London buildings was from a member of the fire department, who, speaking of some late construction, — steel beams, tiling, and brick, — called it dangerous. Buildings of that kind pass with us for fire-proof.

During the last fifty years London has increased in population and size in a way that reminds one very much of an American city. Authorities ascribe this to the fact that, instead of land being leased, many holders have been selling it outright. The result is that people desirous of owning their land and houses have come in large numbers and settled in London.

Even if London had a building law only for the last fifty years, it would be to-day a city of excellent construction; but the building law runs back to the days of King Charles, and the result is a perfect city so far as buildings are concerned.

The causes of large fires in American cities are high buildings on narrow streets with large floor areas, built partially of wood. London is not troubled with buildings of this kind, even of a fire-proof construction, because as far back as 1855, and probably even earlier, the building act passed by Parliament had this clause:

"Every warehouse or other building used either wholly or in part for the purposes of trade or manufacture, containing more than 216,000 cubic feet, shall be divided by party walls in such manner that the contents of each division thereof shall not exceed the above-mentioned number of cubic feet." [1]

[1] The building law as amended in 1890, however, somewhat changed the provisions of this clause, and allowed 450,000 cubic feet to a building, by special vote of the county council, provided it is used for one business not of an inflammable nature. Openings are allowed in the party walls also under certain restrictions.

This would allow a building to be built 60 feet front, 60 feet deep, and 60 feet high. In other words, a building of this kind would contain three floors of only 3,600 square feet to a floor, provided each story was 20 feet high. If a person desired a building of larger floor area than this, he would be compelled to build a less number of stories, or if he wanted more stories he would have to build them less than 20 feet high.

With 3,600 square feet to a floor, buildings perfect in construction, no wood to speak of, the chances of large fires are small in the extreme. Contrast this with the large inflammable buildings which we have, many of them running over 50,000 square feet to the floor, with six or seven stories of equal area loaded with inflammable goods, and you have the easy task which lies before the London fireman, and the herculean task which faces the American fireman.

The largest store of its kind in London is Whiteley's, a large retail dry-goods house. Instead of having large open floors, acres in area, it is divided into numerous low and small buildings, averaging less than 1,000 feet in area to a floor, each building divided by brick walls of great thickness, and with double iron doors where openings are made from one store to another. Its lowness (a characteristic of the London building), the thick brick walls dividing it, the small areas of floor, and the sample-like appearance of its stock, would make it an easy building to handle in case of fire by an American department; yet it has had numerous costly fires, even from an American standpoint.

I noticed one other thing which shows the good business judgment of the mercantile community of London. This is a tendency to divide a large business into separate departments, using one building for storage purposes, another for manufacturing purposes, and a third for showing the stock for sale. The tendency in an American city for using a building not only for sale purposes, but for storage and manufacturing, is not general in London. The result is a decrease in the fire hazard.

Another important practice of theirs is that of not having large windows in their buildings. Their buildings do not present so much glass area in the front and sides as with us. When a fire occurs it is easier to confine it within the building, as the small windows do not present such opportunities for large volumes of flame escaping and setting fire to buildings on the other side of the street.

I have been at some pains to look into the question of the extension of fires in London from one building to another. Of the fires occurring while I was there, quite a proportion

were large, and extended to buildings other than that where the fire originated. Three days after I sailed, on July 18, a fire occurred which involved 50 buildings, 40 of which were destroyed and 10 partially so. The loss according to the newspapers was $7,500,000 — an enormous amount from a London standpoint. The section where this fire occurred I had been through several times. It is in the heart of the city, close to the Mansion House and to the Bank of England. The buildings were low, well constructed, and small in area, and the only difficulty that they presented was the fact that they were partially stored with goods of an inflammable nature. The only way that I can account for such a disastrous and extensive fire occurring in the heart of London among such small buildings is the fact that it was allowed to get great headway, owing to un-American methods of the London service. They are apt to place too much reliance on their building construction, and the slow burning of their fires. The fire service of London, excellent though it may be in many ways, is modelled with the idea of putting out most of the fires that occur, but it is not able to cope with large fires. What we want is their building construction, and what they want is our fire-department methods. There is some excuse for us because of the newness of our country, the rapid growth of our cities, and the fact that our age of wood is not a thing of the past. For London, the capital of a great country, the mechanical ability of whose people is unquestioned, whose common sense is shown in many ways that go to prevent fires, there is no excuse for its not adopting American fire-fighting methods.

It might not be out of place for me to say that I am on record while in London as giving my opinion of the London brigade to a prominent officer of a large insurance company. It was as follows: "That the department had not enough men, its apparatus was not heavy enough to cope with large fires, and that, although they had been more or less fortunate for some time past, yet, even in London, admirably though it was built, there were opportunities which might arise at any moment, and the service would not be able to cope with the crisis." I am free to admit that I do not believe my opinion had much weight at that time, for it is to the credit of London citizens that their service stands high in their estimation; yet my judgment was borne out in fact after my departure by the results of the fire which I have quoted above. The chances for large fires are not so numerous in London, because of construction, as they are with us; yet, because of their service, which is modelled for fighting small fires, there are many opportunities. The changes in

business methods in America have increased our fire risk enormously in twenty years, and even in conservative London they have made the conditions different from what they were twenty and thirty years ago. It seems to me as if the authorities there had not realized this fact.

I was at a considerable disadvantage in Paris owing to my small knowledge of French, and at times it was necessary to pursue my inquiries through an interpreter.

The area of the city is about 30 square miles and the population 2,500,000. It has beautiful squares and streets of more than average width. This is owing mainly to the relaying out of the city some years ago. The water service is good for a continental city, the engines connecting directly with the hydrants. The buildings, although tall, are small in area.

The fire department consists of over 1,700 men of the French army under the usual officers, — colonel, majors, captains, etc. The men are young, but not as powerful-looking as those in an American service. Every three years the rank and file practically change, owing to the expiration of the army service term. They have a system, I was informed, which allows men to serve longer if they desire, and in this way, as the service is considered easy, they manage to keep many men of experience.

I inspected their drill school. In a modified form it resembles an American school, yet it is not of so high a grade or so far-reaching in results as one of ours.

They have about 12 fire stations or barracks in the whole of Paris. Connected with these or close by are the fire-houses, some of which are modelled on the American plan, with sliding poles, hanging harnesses, all complete, as introduced by them some few years since.

The engines have double pumps some 12 or 14 in number, with a capacity of from 300 to 400 gallons a minute. They are excellent in their construction.

The hose is carried on reels attached to wagons, and in the barracks, in addition, they have ladders stored which are drawn to fires by horses. They use hand-pumps and other small appliances to a great extent. Their large ladders are about fifty feet in length when extended; some of them may be a little longer. A few men can handle them, but their methods are slow and complicated. The construction of the ladders, and the method of throwing them, render it impossible to place them in position at a fire with celerity.

I looked in vain for pompier ladders. It is a popular belief on our side of the Atlantic that the American pompier

ladder had its origin in France. If such is the fact, strange to say, the French people know nothing about them. They have a short ladder of the regular style, with a long hook on each side, which they use to scale with from one balcony to another. Their buildings are constructed in that way. This may have given the idea to America; but America has so improved upon it that even its originators would not recognize it.

The use of ropes, life-belts, etc., as practised in American departments, is unknown in Paris. Speaking of the American method of using ropes in saving life, as shown at the congress of firemen in London, a captain of the Paris department expressed to me the greatest surprise at the ability shown by the American fireman. The rope drill, as practised by us, is utterly unknown either in England or France.

Siamese streams are not used in Paris. Once they had the appliances, but they claim they found no use for them.

The American system of shut-off nozzles, and all those modern ideas of fire-fighting, which, in the aggregate, do so much to make a service efficient, I failed to find in either London or Paris.

The hose used principally in Paris — and in this respect it is behind London — looks like a linen fabric unlined. They use some small lined hose, but I saw very little of it.

Paris, like London, has no wires or poles on its streets to interfere with the proper working of its department at fires. There are some overhead wires, but these are carried in the least objectionable way to the firemen — on structures over the roofs of the buildings.

There are but few fire-alarm boxes in Paris. These are small, with glass fronts, placed in a way that makes them hard to find. In addition, they have over a hundred stations scattered over the city, where they have small appliances and a few men. No outsider is allowed to enter the barracks of the Paris department without the consent of the commanding officer. After getting a written permit from the colonel in charge, I was shown the operations of the department by a captain in the service. I asked to be taken to one of these small outlying stations, and he said that there was nothing to see there, that they were doing away with them.

They are putting in a new fire-alarm system which consists of short posts, each about four feet high, on top of which is a square iron box with a glass front. The idea conveyed by the sign attached to it is that the citizen giving the alarm must wait until the apparatus responds.

In these boxes are telephones which, on breaking the glass, allow citizens to send in an alarm of fire. The sup-

position is that by this means they are able to get more detailed information of what is wanted. As far as I could find out, it was a peculiar kind of telephone, which would not allow the fire headquarters to talk back to the party giving the alarm. They could make a signal which would notify that an alarm had been received all right, and that is all. If such is the case, it seems to me that if this telephone system is to be used at all, it should be of such a nature as to admit of conversation backward and forward between the party giving the alarm and the party receiving it. As fast as these boxes are placed in service, the stations, whose places they take, are abolished. The eventual result of this system, if carried out, will be that Paris will have a large number of telephone stations from which to send in alarms of fire. The system, though not perfect, is yet worthy of consideration. In my supplementary report I shall give a more detailed account of it.

A difficulty in all great cities, which we have felt first in America, is that of numerous fires occurring at one and the same time. London and Paris have been trying to cope with this difficulty, but the methods which they follow are not such as meet the case. The time is not far distant when London and Paris will be compelled to follow our example.

When an alarm is received in a Paris station it is sent out in a manner somewhat similar to that of the London department. They have the same circumlocution in receiving the alarm and notifying the various district headquarters and in sending back for more help by messengers. The same criticism can also be made of their service as of the London, viz., the impossibility of centralizing it at a moment's notice and using all the men and apparatus if needed. It is a peculiar fact, yet true, that, although the French have many American appliances for quick hitching and getting their apparatus to a fire, while they connect directly with the hydrant and have their hose joined together ready for use, they fail in many ways. Their horses are not trained to run out to the harnesses, the halters have to be unhitched, and the men lead the horses out by hand. The engines have no method of keeping on steam while in quarters, and they do not make ready for use until after they arrive at a fire. There is an absence of that snap and vigor which characterize an American service. It strikes me that the men are in the same position that we would be in if new and strange machinery was imported into one of our large mills and we had no men who were familiar with its operation. It would be necessary for us to import skilled labor from the country whence the machine came or wait until the intelligence of

the American mechanic found out the secret. What they need in Paris, in addition to copying our ways and methods, is the ability to utilize them to the best advantage.

When the Paris apparatus goes to a fire, it is in no great hurry. On arriving the men run off a line of unlined hose which looks to be 3½ to 4 inches in diameter. At the end of this large hose they have a brass cap which they screw on, and from this run small lines of hose, a trifle larger than ordinary garden hose. They can use two lines, possibly more, in this way from one large line of hose. Some of the small hose is rubber and some of it linen unlined, and with this kind of hose they fight a fire. The size of their engine streams varies from five-eighths of an inch to one inch. As they use unlined hose, with its faulty delivery and tendency to leak, and as the couplings are somewhat on the key-clutch principle, they cannot get efficient water-streams. In America we are particular in the extreme not to allow hose to leak when carried through buildings, yet in Paris they seem to think nothing of this particular point.

Fires very seldom extend beyond the room in which they originate, and the cases are rare in which it gets from one building to another. I was present at a small fire which took place in the basement of a hotel, with small stores in the lower story, and on the stories above were suites for tenants. It was curious to see the people looking down from the windows above at the firemen at work in the basement, apparently not in the least disturbed. They could do it with impunity, for the buildings are not built to burn. The firemen had an arrangement similar to an air-pump which supplies a diver with air, and were working it to furnish air to those who were in the cellar below. The smoke that came out from the cellar did not amount to anything in volume, and for about half an hour the apparatus and the men stood around there, and finally, when the fire seemed to be all out, a man came out who had over his head a diver's helmet made out of light metal. He evidently was the one who was in the thick of the smoke and to whom the air was being pumped. After him came more firemen, and in their hands they had the cause of the fire, about a bushel-basketful of excelsior, part of which was burned.

My stay in Paris was a little over a week, and during that time I saw considerable of the fire service. The arrangement for furnishing air to those in cellars, such as they had on their apparatus, struck me as being too heavy for a man, especially in some cellars such as we have. The idea impressed me as excellent, and possibly might be

used in American cities in cellar fires which did not travel fast.

On all their apparatus the French carry oxygen for the purpose of reviving those who may have been affected by smoke. Here again is an excellent idea, but of its practicability a medical man would be best able to express an opinion.

In their methods and as scientific fire-fighters, the French are somewhat like the English. Neither London nor Paris has had the daily practical experience that the American fireman has. We have learned the trade scientifically from daily combat with fires, unequalled in their fierceness and danger the world over, because of the construction of our cities. It is not science to use the hose they do, and it is not science to have a body of supposed trained men looking after the fire interests of a great city like Paris change so constantly. The trained, scientific fireman comes only with long years of practical experience. In this, both London and Paris seem to be sadly wanting.

The buildings of Paris are better than those of London. Although higher, they are so arranged that all the rooms appear to have windows opening out of doors, and they are erected around interior courtyards. These courtyards, together with many open spaces and broad streets, allow the fire department to reach fires easily and quickly.

The officers and men of the Paris department, like those of London, know nothing about the construction of buildings, neither do they make inspection of them, nor are they by rule compelled to have a knowledge of their interior or exterior construction. The London service is under civilians, and some people may give that as a reason for its action, but the Paris service is military, and so much is claimed for the military, that it is a strange comment that this most essential thing in fire-fighting, viz., that the officers at least should inspect and know their buildings, is completely ignored in Paris. They have plans on file at the headquarters of the public buildings and of theatres, and this is the nearest they come to paying any attention to building construction. I asked an officer how they found their way in a building on fire, and he replied that the owner or somebody round there showed them.

Paris uses the army for a fire department, in my opinion, first, because of its cheapness; lastly, in order that so large a body of men may come under the jurisdiction of the national government, not the municipality of Paris. The police come under the national government for the same reason.

The life-saving appliances in Paris, from my limited examination, can bear no comparison with those of an American city. They are not even abreast of the London service; in fact, the engine and fire appliances of Paris would hardly be large enough in number for an American city of 100,000 population, and would not be for Paris, were it not for the wonderful building construction.

In my opinion, it would be well for us to consider the question of a heavier system of policing and patrolling on the part of the fire department in the extreme hazardous sections of Boston. If foreign cities find it beneficial, why not Boston?

In the engines which I saw in England, outside of London, the idea of having three pumps seemed to me to be an improvement on the average two-pump engines. In Paris, they have in service boilers on their engines of a water tubular pattern. Attached to the boilers is a light condenser to exhaust the steam back into the boiler, or they can exhaust into the air.

It might be possible for an engine to be built with three pumps instead of two, and by adopting the system of water tubular boilers, get better results than we receive from our engines. The gain from an engine of this kind would be economy in the use of fuel, lightness in weight, and large water-throwing capacity.

Water tubular boilers, I understand, have been tried in England in connection with fire-engines, and it is claimed that they are a success. We might submit the question as to the feasibility of this proposition to the engineer of the city of Boston. In this connection it would be advisable also to have a scientific test made by him of the number of gallons per minute the engines of the Boston fire department are able to throw on a fire, not alone in theory, but in actual, practical work. The result of this test would best show the wisdom of trying this new system of engine. In connection with this test, the principles of getting the best results from two-way, three-way, and four-way siamese streams could be obtained; in fact, the whole question of water delivery could be investigated, especially the subject of a lighter substitute for the present heavy suction used in connecting an engine to the hydrant.

There is no doubt that the great danger of Boston in the future is from the faulty construction of the past. It is essential that not only the officers, as is now the case, should have a thorough knowledge of construction of buildings, but that as far as possible it should extend to the men. Our patrol system makes it possible for a man to know the con-

ditions that surround buildings on the outside. By allowing them access to maps it is possible for them, in theory, to obtain a knowledge of their inside construction. It seems to me that when promotions occur hereafter, it would be advisable to embody as part of the subjects in which the men should be examined, their knowledge of the results obtained from water, as developed by the tests which I have suggested, and also their knowledge of the outside and inside construction of buildings in the district where they have done duty.

I noticed in Paris, in some of the large buildings which I personally examined, there were men attached to the store, who were formerly members of the Paris brigade. Their duty, I was informed, was to patrol all the floors of the building, and see that the goods were so placed, and everything carried on in such a manner, that the danger from fire was minimized. This is an idea that can be enlarged upon here in Boston. In each of our large establishments that are considered hazardous, a fire department can be formed out of the employees, and the organization be made under the supervision of an officer of our fire service. To get the best results from such an organization, it should be inspected at stated intervals by a fire official. This inspection should extend to the fire appliances of the building.

I have examined the building laws of Paris and London, as well as the laws governing explosives and petroleum, also their system of inspection, and other matters of importance, and will submit, as soon as possible, a separate report upon those subjects.

SUPPLEMENTARY REPORT.

There is no way of ascertaining the actual fire losses on property in London. The fire brigade keeps no record. They say that it is not their business to do so. Unlike us, they give no attention to this point.

It is also absolutely impossible to obtain exact figures of the losses of insurance companies, for any year or series of years. It is the custom of every company (with some exceptions) to publish full particulars of its receipts and loss payments as a whole, at home and abroad. But no company thinks to make public its experiences in any London district. The reason for this is, that if the experience be an adverse one, the company can quietly curtail its operations in that district; and if favorable, it can continue to make a profit without attracting too much attention. The correct figures, doubtless, are in the hands of some insurance managers, but they do not make them public.

London is divided for insurance purposes by each company into practically three sections: the West End, for good residential property; the city, for large wholesale and retail warehouses, and storage risks; and the East End, for manufacturing and residential risks.

The residential insurances are on a good paying basis. Although the rates vary from $\frac{1}{6}$ per cent. to 2 per cent., the loss ratio of the larger companies fluctuate between 5 and 15 per cent. of the gross premium income of these West End branches. This statement applies to three of the principal insurance companies of London. Separate figures for the East End and city cannot be obtained, but the combined percentage for London is estimated as follows:

During the last ten years the percentage of losses has fluctuated between 40 and 60 per cent. of the premiums. The loss for last year is estimated as not exceeding 50 per cent., and it varies from about 25 per cent. in one company to about 70 per cent. in two other prominent companies. This is based on the judgment of authorities. It is not too much to estimate 50 per cent. of the premiums as the loss.

This is about the same showing on insurance profits as that made by the Boston insurance companies during the last ten years, with this difference, that the insurance rates are at least twice as high in Boston as they are in London.

The yearly premium receipts for the London district in detail it was impossible for me to obtain, but it may be calculated on a basis of $\frac{3}{6}$ per cent. on the total insurance of the companies, based upon their contribution to the support of the London brigade. This would be about £1,432,000. The insurance companies are desirous of making as large a profit as possible in London, because the business there is usually reckoned to cover deficits in what they call the provinces and abroad. The business of the fire offices for the country and abroad shows a total loss of 13,000,000 on a premium income of 19,000,000.

The insurance commissions paid to agents are reckoned at about 16 per cent. The expenses of management, it is claimed, are 18 per cent.

According to the annual report of the London Salvage Corps, which is supported by the insurance companies to look after their property, it is estimated that 25 per cent. of the total number of fires in the metropolitan area have no insurance. This is an extraordinarily large proportion, but the statement, coming from such an authority, cannot be questioned. Many small householders and business firms do not insure at all.

The salvage corps' report draws attention to several peculiarities in fire risks. In 11 years the number of fires has increased 60 per cent., and the serious fires have fallen from 14 to 6 per cent. The claim is made that this result is caused by the special attention given to the isolation of portions of large warehouses and storage premises, and also to a lately introduced system of patrolling and inspecting under the directions of the fire-insurance managers. The best results have been shown in wharf and warehouse business.

As near as I could ascertain, what they call warehouse business means a business carried on in any building occupied by a firm in the dry goods, furniture business, etc.

They seem to have had a somewhat similar experience in London to what we have recently had in our American cities, doubtless coming from the changes in business methods, to which I have heretofore alluded.

About two years ago, the centre mile in London, around the Mansion House, was yielding large fire losses in what they called "warehouses," dealing in Manchester goods of a nature similar to dry goods. The insurance was raised 50 per cent., the results showing a loss even then; and while I was staying in London the companies were considering the question of making a still further increase of 20 per cent. on insurance rates. Their method of increasing the rate was to take every warehouse dealing in Manchester goods, and

raise the premiums in the proportion that I have mentioned. But they did not apply this increase to every business building in the district.

I found it impossible to obtain definitely the number of fires in London causing a loss of over $25,000, but doubtless those marked "serious" in the brigade report are above that amount. In regard to notable fires, the reports of 1892 will show the cases of extension from one building to another. The construction of their buildings is of such a nature that the losses are confined generally to the building in which the fire originates, although during my short stay there were a number of extension fires fully as large as would have occurred during the same time in any American city.

For many years London has been singularly free from disastrous fires. Recently, however, she has had a different experience. The history of fires in great cities is more or less similar. They may have years free from conflagrations, and then they come with a vengeance. London has been no exception to the rule.

It has been said again and again that conflagrations were limited to American cities, owing to the wooden and careless construction. London has been held up for our edification. Yet a week or so ago they had a large conflagration, and a few days later they had another. Of the latter one it has been impossible for me to obtain the exact losses, owing to the peculiar methods that characterize the fire brigade's records. In this fire, the newspapers claim that the losses are between seven and eight millions. (See Plate No. 1.)

The accompanying plan of the fire was sketched and afterwards verified by a competent engineer. The amount of territory burned over was large. Forty buildings were destroyed, and 20 partially so. The buildings were all very small in area. The heights of the buildings ran from $3\frac{1}{2}$ to 5 stories, very few of them the latter height. The buildings were well constructed, in many cases occupied by offices, and presented no great difficulties in case of fire from the construction standpoint. The fire started in the corner of the building, at the point marked by a star, in the stationery shop of William Brown & Co. Owing to the slowness of the methods characterizing the fire departments on the other side, and the inflammable contents of the building, the fire, doubtless, got great headway. Even under these drawbacks it would seem, however, that, with so many partition walls, the fire should have been confined to its point of origin. If in such buildings as these in London, which are built not to burn, a

disastrous fire of this kind can occur, the wonder is that in American cities, with their large-area buildings and wooden construction, we have not had greater conflagrations.

The history of fires in New York, Chicago, and Boston shows somewhat similar results. A few days ago New York (if you will remember) had a large fire, the loss upon which, according to reports, was over $2,000,000. I say, according to reports, because the final results, doubtless, will curtail that figure. (See Plate No. 2.)

I submit a plan of that fire. The star marks the place where the fire started in Campbell & Co.'s paper-hanging establishment. The unbroken floor area of the building where the fire began was large. The result was inevitable, with such a large area filled with inflammable material. A great volume of flame was produced, and although 46 pieces of apparatus were on duty, the flames jumped a street 55 feet wide, and burned over 20 buildings.

If at this fire there had been other large-area buildings adjoining the territory burned over, it would have required all the efforts of the excellent New York service to have prevented further spread, and it is a question whether they would have succeeded in so doing.

I submit a plan of a fire in Chicago that occurred some time ago, which still further illustrates the dangers from large floor areas and ill-constructed buildings. The star shows where the fire started. It began in a one-story frame shed in the rear of a block of five buildings full of windows, and from this block the flames jumped a street 80 feet wide and burned the low buildings on the other side, three and four stories high; also the low buildings in the rear, on the other side of School street. The number of buildings affected in this fire was about 20. (See Plate No. 3.)

Here, again, was a case that, owing to the fact that in the neighborhood there were only low three-story brick buildings, the fire did not extend farther. The number of engines at this fire was thirty-four. It required the united efforts of a large part of the Chicago service to stop this conflagration.

We have, as you well know, the same trouble in Boston that they have had in New York and Chicago; but our large floor area buildings appear to be more poorly constructed than in the latter cities, and we are unfortunate in the sense that they are in the neighborhood of other large-area buildings, and are surrounded by narrow streets. I submit a plan of the Hecht building fire. (See Plate No. 4.)

The point where the fire was supposed to have started is shown by the star. It jumped across the small passageway (over the skylight), 8 feet in width, into the Summer-street

building, which had no shutters. By the falling of the walls the fire went into the building next the one without the shutters, also into the annex buildings on the Federal-street side, connected with the main building by iron doors. The construction of this building was the usual American construction which characterized buildings fifteen years ago, — plenty of wood, some iron and brick.

These three fires owe their spread to the vast volume of flame generated in a large floor area. In view of the construction of the buildings, and of the result of these fires, a great deal of credit should be given to the respective fire departments, especially so when we compare the fires with the plan of the fire in London, which spread as far and destroyed more buildings. With us they would be considered, from their small size, numerous brick partitions and good construction, extremely easy to handle in case of fire.

I personally inspected six of the most difficult "warehouse" risks in London. The business is similar to our large retail houses. The following are the risks.

The Army and Navy stores pay an insurance of thirteen shillings to a hundred pounds:

	Insurance.
Whiteley's (special)	21s.
Maple's shop and stores	10s. 6d.
Shoolbred's	13s.
J. & R. Morley	9s.
Hitchcock Williams	11s.

The plans of these buildings show the benefit accruing from the building laws, which limit not only areas, but the heights of the buildings, by the clause which says, "the cubical contents of any building shall not be over 216,000 feet." This law also compels the use of fire-proof material, and limits the style of doors that shall be cut through walls.

My personal inspection of these buildings showed that the floors were generally of concrete, the roofs of slate or metal, the ceilings concrete, arched bricking used everywhere, openings made in the walls protected by double steel doors, party walls of great thickness, subways from one building to another rather than passages overground,— in short, everything was done to produce perfect construction. The reason for this action of the occupants was that they might obtain low rates of insurance. Yet with all this excellence of construction in London, there are many large houses, as in Boston, who have to go abroad to obtain all the insurance they want.

The buildings of Maple & Co., upholsterers, cabinet-

building, which had no shutters. By the falling of the walls the fire went into the building next the one without the shutters, also into the annex buildings on the Federal-street side, connected with the main building by iron doors. The construction of this building was the usual American construction which characterized buildings fifteen years ago, — plenty of wood, some iron and brick.

These three fires owe their spread to the vast volume of flame generated in a large floor area. In view of the construction of the buildings, and of the result of these fires, a great deal of credit should be given to the respective fire departments, especially so when we compare the fires with the plan of the fire in London, which spread as far and destroyed more buildings. With us they would be considered, from their small size, numerous brick partitions and good construction, extremely easy to handle in case of fire.

makers, and general house furnishers, are divided into three divisions. I found the construction well-nigh perfect from a fire standpoint. In addition they seemed to have provided every appliance in the way of hose, night watchmen, etc., for meeting any possible emergency. (See Plate No. 5.)

The average area of each building in division 1 is 1,256 square feet; the heights of the buildings vary from 3 to 4 stories, and in some instances they are 5 stories high. The stories are excessively low studded, and the 5-story building in this case, as in most London buildings, appears to be not higher than an average 3-story building in America. The total number of buildings occupied by Maple & Co. is 75 in one division, 12 in another, and 5 in a third. The result of having so many buildings divided by brick walls, with double iron doors covering the openings (and the size of these doors limited), is the general prevention of the spread of fire beyond the building where it originates.

The theory of the construction of all large buildings in London is to be praised. It is the same principle which makes the modern ocean steamer well-nigh unsinkable. A series of water-tight compartments, with all connections provided with doors, has robbed the sea of many of its dangers. The same principle, with fire-proof construction, applied in buildings in London, has prevented the disastrous fires from large floor area buildings by which American cities have suffered.

A few of the marked characteristics of Maple & Co.'s are concrete ceilings, in many cases stone stairs, windows protected by iron shutters, and the isolation of the dangerous portions of the business in specially constructed buildings, so that in case of fire that particular portion of the business would be injured and no other.

What is true of the construction of Maple & Co.'s is equally true, to a greater or less extent, of the plans of five other buildings.

The Army and Navy Coöperative Society carries on general stores somewhat similar to one of our large retail dry-goods houses. One portion of their business is in stores between Victoria street, Howick place, and Artillery row; the other portion between Francis street, Howick place, Spencer place, Greencoat row, and St. Margaret's place. The average area of the buildings in the first division is 1,090 square feet; the total number of the buildings is 49 in the first division, 23 in the second, and 10 in the third. The heights of the buildings are 3 stories, 4 stories, and in a few cases 5 stories. (See Plate No. 6.)

In the examination that I made of these stores, it struck

me that their construction was a little better than the average London building. They were provided with brick arches, stone stairs, numerous thick brick partition walls, and an isolation in separate buildings, with brick arched floors of the departments where danger was to be expected from fire. The streets were fairly wide, especially so when the heights of the buildings are considered. In the immediate neighborhood there appeared to be no other large buildings. This reduces the danger.

In William Whiteley's stores there have been many costly fires in times past, involving large losses, yet, owing to the method of subdivision into numerous small buildings by partition walls, the fires have never completely destroyed the whole property. It is divided into two distinct parts by Douglass place, under which subways are run. The total area of one part is 70,400 square feet, and it is divided into 109 buildings. The area of part 2 is 72,000 square feet, divided into 40 buildings. Owing to the fact that the rate of insurance paid upon these buildings is 21 shillings, and the reputation they have enjoyed for large fires, my examination was very thorough. The portion of the stores facing on Queen's row are of first-class construction, — concrete, stone floors, walls of great thickness, double doors protecting openings in the wall, and brick arches in the basement. In short, everything seemed to have been done to prevent the spread of fire. (See Plate No. 7.)

Whiteley's stores are considered the most extensive of their kind in London. This business is like that of Jordan, Marsh, & Co , or R. H. White & Co., or even a little more extensive, as he deals in oils, paints, provisions, and flour, and has a book-bindery, a butcher shop, and other things that seem a little out of place in a dry-goods store.

If the same buildings were in Boston they would be considered a cheap fire risk. The owner, however, I am informed, has been unable to get all the insurance he wanted. The height of the buildings is so low (in some cases they hardly average as high as an ordinary American dwelling-house), and their construction is so good, that the fire department, either in Boston, New York, or Chicago, would have no trouble in preventing much damage in case of fire.

The business quarters of Shoolbred & Co., drapers and house furnishers, face on Tottenham-court road, 82 feet wide; Grafton street, 49 feet wide; Huntley street. 45 feet wide; and University street, 44 feet wide. Four stories is the average height of all the buildings, and very low stories at that. Measured by the eye, they appear to be about 50

feet high, or even less. Here I found concrete ceilings in many parts, slate and metal roofs, thick brick walls with double fire doors protecting the openings, and a well-constructed building. The total area which the external walls of the building enclose is 72,000 square feet. The number of buildings into which this area is divided is 56. (See Plate No. 8.)

The buildings of Hitchcock, Williams, & Co., facing on Paternoster row, Paul's alley, and St. Paul's churchyard, are situated in a section where some disastrous fires have occurred. The total area of the buildings is 24,000 square feet. This area is divided into 30 buildings. The height runs from 3½ stories to 4, and in a few cases 5. The same good construction and the use of thick brick partition walls is to be found here. In fact, you find it everywhere in London. (See Plate No. 9.)

Messrs. I. & R. Morley, situated on Gresham street, Mill street, and Wood street, is divided into twenty-eight different buildings. The total area within the external walls is 35,100 square feet. The number of buildings into which this area is divided is twenty-eight; average area of subdivisions, 1,243 square feet. (See Plate No. 10.)

My reasons for referring to these buildings are: first, to give an idea of their excellent construction; next, to show the common-sense methods which characterize the business men of London in isolating the dangerous portions of their business, and in the use of brick partition walls, which is the greatest safeguard for the prevention of the spread of fire.

Again, I desire to contrast the easy task which the London buildings present to the English fireman with the problem which faces the American fireman from poorly constructed, large-area buildings.

To illustrate, and for comparison, I submit the following plans of American buildings:

No. 11 represents a seven-story and basement, composition roof, iron shutters, mill construction, well-built building in Chicago. The fact that it is divided into four parts and is surrounded by broad thoroughfares, and its general good construction, makes it a very excellent fire-risk.

No. 12 represents a second square or building in Chicago. It is divided into eleven different buildings, separated in the most part one from the other. It has the same good points that mark the first building. In addition to the excellent construction and the broad streets upon which the buildings face, which are marked characteristics in Chicago, the law regarding the erection of standpipes is to be commended. Buildings of a certain number of stories and over a certain floor area are required to have permanently fixed on the out-

side pipes of the requisite diameter with connections at each story, and iron ladders with balconies. It places the Chicago Fire Department in such a position that when they arrive at a fire they have, by means of this law, water-towers all ready for use and ladders fixed in position with which they can reach the top of any building. The good point of this permanent pipe, with its connections for hose, is the fact that it means no extra expense for water to owners or occupants. The engines make connections from the bottom and supply the water from the public mains.

Nos. 13 and 14 are representative buildings in New York City. The widths of the streets on plan No. 13 are 100, 75, and 60 feet respectively. The building in question is large, situated on a corner and divided into three parts with double iron doors, which help wonderfully to protect from the extension of fire. The general construction is good; the height, 7 stories in two of the parts and 8 stories in the third division.

No. 14 represents one business facing on two streets of 100 feet in width and one of 60. It varies in stories from one to five, as shown by the marginal figures. One portion divided from the main building by brick walls is 9 stories high. General construction fair.

The New York and Chicago buildings represent the business of one firm.

Plans Nos. 15 and 16 take in squares of property in Boston and represent the business of different firms; yet in single instances they show larger unbroken areas and that lack of division brick walls which characterize Plans 11, 12, 13, and 14. The narrowness of the streets with us is remarkable.

In No. 15 the numbers round the edge designate the stories. The large floor areas which characterize some of the buildings are extremely noticeable.

Plan No. 16 takes in a little more than one block or square, and has all the points that handicap a fire department that you find in plan No. 15.

The scale of all these plans being drawn 70 feet to the inch, it is comparatively easy, by actual measurement, to estimate the areas of the respective buildings; and it does not require any expert knowledge to see the advantages of one city over the other.

The following table gives the largest areas of the buildings in the plans submitted:

Large area building in London plan .	None.
Largest area building in New York plan (unbroken by partition) . . .	22,800 sq. feet.

Largest area building in Chicago plan (unbroken by partition) . . .	24,300 sq. feet.
Largest area building in Boston plan (unbroken by partition) . . .	52,000 "

New York has buildings of larger area than those of which plans are submitted, but in many cases they are of fire-proof construction, and the same is true of Chicago.

The laws governing explosives, petroleum, etc., in London are very exhaustive, and contain points which I recommend to the Boston commission's consideration.

I gave some attention, as instructed by the Board, to the Metropolitan Buildings Act and the various laws governing buildings in London. I have also made a comparison between them and the New York and Boston building acts.

There are 550,000 to 600,000 buildings in London, none of which are of wood, and of this great number previous to 1890 there were only two or three that violate the law and exceed a greater dimension than 216,000 cubic feet, or an area of about 3,600 feet to a floor if there are three stories 60 × 60 × 20. One of these buildings is a large gas retort and one an electric-light company station, for the building of which special parliamentary sanction had to be obtained.

Fancy in Boston our being obliged to go to Washington in order to obtain permission to build a large-area building! The twenty-ninth section of the London County Council Act of 1890, which allows buildings used for one business of a non-inflammable nature (by special permission of the county council) to be built containing 450,000 cubic feet (this is a building of about 77 feet front by 77 feet deep by 77 feet high), has only permitted the erection of 15 warehouses. In other words, there are in London only three buildings, built by special permission of the English Parliament, larger than 216,000 cubic feet, and only 15 which reach the maximum of 450,000 feet. If under the London law a larger floor area than about 3,000 square feet is to be obtained, the building must be two stories or one story in height according to the area of the floor desired.

If our American cities were built on this plan, what a wonderful improvement there would be in our fire records!

London's advantage at present is that she has been reaping the benefit of excellent laws for years, while in New York and Boston they are in their infancy.

It would be well to look into the portions of the law which cover fire-escapes, theatres, protection of light wires used in electricity, of which Boston takes no notice, and the legal portion, especially that which refers to the court decisions.

The area of light wells is not allowed to go below 100 square feet in London, and must be built of fire-proof material. In Boston and New York they are not limited, and as a result we have reached a very poor state of things in this direction. Many of our so-called light wells are so small that they are like flues of a chimney.

The building laws of Boston at the present time resemble in many particular points those of London. They are to be commended in the main. Doubtless, during the next year or two, experience will show necessary changes that should be made, if it has not already done so, and our laws will be the perfect ones that a city of Boston's wealth and population demands.

New Fire-Alarm System in Paris.

Paris is divided into 24 districts. Each district has a central station equipped with the necessary fire apparatus and a number of men, some of whom are qualified to operate the electrical apparatus.

These central stations vary somewhat in the extent of their equipment, the more important of them being denominated "casernes," and the others "post centrals," the latter being located in the less important districts, and only having electrical connection with the fire-alarm boxes in their district and the caserne most convenient to them.

There is one central station, which is the headquarters of the entire system.

Each caserne is connected not only with its dependent post central station and some fire-boxes, but to the main central station. The system is operated by two methods. By the use of a double wire cable, connections are made between the several stations, and so arranged that when standing at rest a ground circuit is formed through a set of electro-magnetic apparatus located in the central stations, termed in this system the "Morse Special."

This apparatus is controlled by mechanical devices in the fire-alarm boxes, which are set in motion by the person giving the alarm. An inscription on the outside of each box says that he is simply to break the glass inserted in the centre of the door to ensure the desired result. The act of breaking the glass produces three results, viz.: The door is thrown open and a mechanical gong on the inside of it is set ringing in the same manner and for the same purpose as those of the keyless doors used in the Boston system. A bell in the central station is also set ringing, indicating to the men in charge that a call has been made for some box in their

district. The mechanism of the box is also started automatically, a part of which consists of a wheel somewhat like that in the old district box abandoned in Boston years ago.

The revolution of this wheel transmits to the central station a series of arbitrary signals, which are recorded on paper by a Morse register, and when translated by code, indicate the box from which they were sent. By a further action of the signal wheel the "Special Morse" circuit is opened, and a metallic circuit established through the telephones, which also form a part of the equipment of each fire-alarm box.

On the inside of each fire-alarm box are displayed further instructions to the senders of alarms, to the effect that they shall immediately communicate to the central station, by means of the telephone, the location and character of the fire or other cause for which the call was given. The boxes contain no receivers, consequently the person sending a message has no means of knowing whether he has been correctly understood. He is only informed by an inductive sound in his transmitter, made by the person at the central station, that a message has been received. In addition the central stations are equipped with a telephonic system, and are able to talk with any other central, or with the grand central, as occasion requires.

On the receipt of an alarm, the party receiving it at the central makes such a disposition of the apparatus as the size of the fire may require, by calling upon the posts de ville or apparatus houses within his district. If in his judgment there should be additional apparatus sent, he calls on the main central for further instructions. The whole matter of moving the apparatus is performed with the telephones, no use being made of the special Morse service except that of indicating the signal-box from which the call was sent. If, however, the telephone service should fail, they then use their Morse apparatus to transmit their messages between the central stations.

Notwithstanding the fact that their wires are so placed beneath the streets as to secure almost absolute safety to them (chiefly on account of the subways for sewers through which they pass being so admirably constructed, and because no high-tension currents from other service are being discharged into the earth, as in the city of Boston), they take every precaution to avert or correct any faults that might occasionally become manifest.

Their lines and stations are tested every day during the stormy periods of the winter season, and once a week at other times.

This system, as here described, appears to be well contrived, carefully constructed, and is, no doubt, successfully operated. While it is probably everything that a city like Paris requires, with its practically incombustible buildings and broad avenues, it is evident that the tinder-boxes of Boston would have little chance for safety should a fire in any of them be allowed to have its way while the apparatus was being instructed to proceed to the spot by any such elaborate process.

The system which we have inaugurated of having a telephone in connection with the fire-alarm boxes in Boston on special circuits, independent of those now in use, should be extended, and the idea of using telephones for sending in alarms of fire after the box has been operated should be thoroughly investigated. To have telephones in all boxes would be at least a useful auxiliary to the present Morse key, and it seems to me as if it could be made as reliable, if not more so. It would serve one purpose, that of minimizing the danger of losing an alarm when more than one box is pulled at the same time for the same fire.

The idea which is embodied in the Paris service of automatically sending in an alarm by the mere breaking of the glass should be adopted in the American fire-alarm box. Considerable time would be saved over the present system, which necessitates opening the box and then pulling down the hook before an alarm is sent.

The time has come for using a telephonic system as an auxiliary, or even more than an auxiliary, to the present system in use in American fire-alarm departments. It is true that we use it in our covering system between our various houses, but we should go one step further and see if there is not an advantage to be gained from embodying it in our public fire-alarm system.

All the above statements I have endeavored personally to verify. The plans of the fires and of the buildings in London are verified by competent men. The information regarding London insurance has been obtained from managers in the business of high standing. I have every reason to believe that it is reliable. London is a great centre for the insurance business, not only of England, but of other countries. The methods of carrying it on are admirable, and the desire on the part of the managers appears to be to obtain a fair profit on their investments.

In Boston our heaviest losses — and we are no exception to the rule — have been from dangerous fire-risks, well known to insurance and fire men. It will be years before we will reap the benefit of good building laws. In the

mean time, buildings of bad construction, which have been built in years past, should be specially marked, and everything done to minimize the danger from them in case of fire. They should be patrolled, together with the dangerous sections of the city.

The plan of the Board to strengthen the service, both in water-supply and apparatus, in the heart of the city should be carried out, and the suburbs of the city receive just what they require at the present time, and not what their possible needs will demand some years from now.

The plan of fixed pipes with water connections, and iron ladders and balconies on dangerous buildings, should be considered, and, if found advisable, their adoption compelled by law.

Wires running near dangerous risks should be put underground, or where that cannot be done, run over the tops of the buildings.

Coöperation on the part of our citizens with the authorities to bring about the same favorable conditions as exist in other great cities will aid materially to reduce the fire-risks of Boston.

Respectfully,

JOHN R. MURPHY.

REPORT OF THE CITY ENGINEER ON TESTS OF ENGINES.

Engineering Department, 50 City Hall.

Mr. Robert G. Fitch,
Chairman Board of Fire Commissioners:

Dear Sir: In compliance with your request of September 21, 1893, a series of tests have been made of the different types and sizes of the steam fire-engines in use in your department, for the purpose of determining, as nearly as practicable, their capacity and efficiency under the conditions actually occurring at fires.

Incidentally, tests were made of the comparative efficiency of $2\frac{1}{2}$-inch and 3-inch fire-hose, of the discharging capacity of the fire-hydrants, and of the efficiency of the water-tower. The tests were made under the immediate supervision of Assist.-Eng. Dexter Brackett, and the method of conducting the tests was as follows:

All of the tests were made at the Water Department yard on Albany street. The engines tested were connected with and drew their supply from a Post hydrant located in the yard, and connected with the 12-inch main in Albany street by an 8-inch main 240 feet in length.

The water-pressure at the hydrant was about 42 lbs. when the engines were not drawing.

The hydrant has an inside diameter of $6\frac{3}{4}$ inches, with three outlets for hose connection, two of $4\frac{1}{2}$-inch diameter and one of $2\frac{1}{2}$-inch diameter, each outlet having an independent valve.

The steamers were connected with one of the $4\frac{1}{2}$-inch outlets by means of the ordinary 4-inch suction-hose, and with one or two exceptions, of which special mention is made hereafter, all valves on the supply-main and hydrant were kept wide open during the trials.

Frequent pressures were taken by means of a gauge connected with a piezometer which was coupled to the hydrant nozzle and to which the suction-hose was connected.

All water used in the boilers was carefully weighed and the quantity checked by meter measurement. All coal used by each engine was weighed, but no attempt was made to obtain the amount of ashes or unburnt coal. All gauges used were carefully tested by means of a Crosby gauge tester and the readings corrected when necessary. The hose used was new Callahan jacket hose having nominal diameters of $2\frac{1}{2}$ and 3 inches, but the actual inside diameters were 2.65 and 3.30 inches.

The length of hose used during the tests was usually 500 feet for each line except when using the large siamese nozzle, in which case lines 200 feet in length were used. During some of the first tests made the lengths of the lines were 400 feet.

At the Lincoln-street fire the average length of the 71 lines of hose used was 530 feet and at the Tremont Temple fire it was 500 feet.

Standard smooth nozzles were used in all tests, with a single exception, when a test was made to show the comparative efficiency of smooth and ring nozzles. The quantity of water discharged by the steamers was calculated from observations of the pressure, made by means of gauges attached to piezometers at the base of the play pipes using the well-established formula deduced from the experiments of Mr. J. R. Freeman. The experiments of Mr. Freeman, which were made with great care and covering a great variety of patterns of nozzles as well as a large range of pressures, proved that by carefully conducted observations the discharge from any of the standard nozzles can be determined within one-half of one per cent.

Careful measurements were made of the diameters of the nozzles, and in nozzles of the same nominal diameter there was found a variation of .014 of an inch.

The engine tests were conducted in the following manner:

Steam was first raised in the boiler to a pressure at which the engine could do practical service; the fire was then drawn and a new fire started with weighed fuel. As soon as the steam pressure began to rise the engine was started, and run with, as nearly as possible, a uniform steam and water pressure.

Changes in the conditions were made at periods of from fifteen to thirty minutes, either by changing the sizes of the nozzles, the steam pressure, or the length or size of the lines of hose, the object of the tests being to ascertain the quantity of water which each engine was capable of throwing upon a fire in continuous service, and not the quantity which might possibly be discharged through a short line of hose or an open butt for one or two minutes.

Observations of the steam and water pressures at the engine were made every minute, and of the water pressure at the nozzles every thirty seconds. In the tables giving the results of the trials averages of these observations are given.

All coal used under the boilers and all water fed to the boilers were carefully weighed. Pressures were taken on the supply-main at the base of the hydrant, on the 2½-inch outlet of the hydrant and at a piezometer attached to the 4½-inch

outlet with which the suction-pipe from the engine was connected.

These pressures were taken to show the loss of pressure by friction in the hydrant and the available pressure in the steamer suction. In the tests of Engines Nos. 27, D, 36, and 15 pressures were also taken at the suction chamber of the engine.

Calorimetric measurements of the amount of moisture in the steam furnished by the different types of boilers were made on Engines No. 27, No. 15, and No. 23.

Indicator cards were taken from the steam cylinders of Engine D and Engine No. 15.

The number of revolutions made by the engines were electrically recorded by an instrument made by an employee of the Fire Department.

Each revolution of the engine closed a circuit and was recorded on a paper tape. By the use of a stop watch the number of revolutions per minute was easily and accurately determined.

In order to obtain information in regard to the effect of a hydrant supply as compared with drafting, tests were made of Engines No. 43 and No. 36 taking water from a large box which was floated in the dock alongside of the Water Department wharf. The box was supplied with fresh water from a hydrant in the yard.

Tests have been made of Amoskeag engines of four sizes, three sizes of Clapp and Jones engines, and two sizes of engines of the Silsby pattern. These comprise the patterns and sizes of engines which are now in general use by the department.

Table No. 1 gives the general dimensions of these engines, and the statements and tables appended to this report give in detail the results of all the trials.

ENGINE NO. 36.

Calculated capacity at 300 revolutions per minute 498 gallons. Tested November 8, 1893.

The engine was started at 1.14–40 P.M., with steam at 60 lbs.

From 1.14–40 P.M. until 2.29–30 P.M., or 74 minutes 50 seconds, water was forced through two 500-foot lines of hose and discharged through two $1\frac{1}{8}$-inch nozzles. The steam pressure during the greater portion of this time was from 60 to 80 lbs. and the average water pressure at the engine 130.9 lbs., with a discharge of 562 gallons per minute. The engine was shut down for 4 minutes 35 seconds for the purpose of changing the size of nozzles and removing the strainer in the suction-pipe, as there was a loss of from 3 to 4 lbs. pressure between the hydrant and the suction chamber of the pumps. The engine was then run for 42 minutes 35 seconds with a steam pressure of 106.3 lbs., water pressure at the engine 128 lbs. with a discharge of 579 gallons per minute through nozzles $1\frac{1}{4}$-inch and $1\frac{1}{8}$-inch diameters.

After the removal of the suction strainer the pressure in

the suction chamber of the engine was practically the same as at the hydrant. A run of 8 minutes 20 seconds was then made using 500 feet of $2\frac{1}{2}$-inch hose with a $1\frac{1}{4}$-inch discharge nozzle, followed by a run of 16 minutes using the same length of 3-inch hose with a $1\frac{1}{4}$-inch nozzle.

During the first run with a water pressure of 244.5 lbs. at the engine the average water pressure at the nozzle was 82.5 lbs., while during the second run the water pressure at the engine was about 40 lbs. less, but 14 lbs. more at the nozzle.

The engine was then stopped, the fire drawn, and the size of the two exhaust pipes reduced from $1\frac{1}{8}$-inch to $\frac{15}{16}$-inch diameters by plugging with wedges. The engine was again started at 3.58 P.M., pumping through two lines 500 feet of $2\frac{1}{2}$-inch hose connected by a siamese coupling with a $1\frac{1}{2}$-inch nozzle.

Under these conditions a water pressure of 147 lbs. at the engine was maintained for 9 minutes 15 seconds discharging 564 gallons per minute. The $1\frac{1}{2}$-inch nozzle was then replaced by two nozzles, $1\frac{1}{4}$-inch and $1\frac{1}{8}$-inch diameters, and the engine run for 17 minutes 30 seconds with a water pressure of 136.4 lbs. at the engine discharging 596 gallons per minute.

On November 14th a second trial of this engine was made, drafting the water, with a lift of from 10 to 12.5 feet instead of taking the supply from the hydrant under a pressure of 35 lbs.

For 62 minutes 20 seconds water was thrown from two $1\frac{1}{8}$-inch nozzles through 500-foot lines of hose, with an average steam pressure of 90 lbs., water pressure at the engine 111.4 lbs., at the nozzles 46.2 lbs., with a discharge of 512 gallons per minute.

A $1\frac{1}{4}$-inch nozzle was then substituted for one of the $1\frac{1}{8}$-inch nozzles and the engine run for 28 minutes, giving an average steam pressure of 78.5 lbs., water pressure at the engine 110.8 lbs., and at the nozzles 35 and 46 lbs., with a discharge of 512 gallons per minute. With two lines siamesed using a $1\frac{1}{2}$-inch nozzle a discharge of 575 gallons per minute was maintained for 9 minutes with a nozzle pressure of 65.7 lbs.

A comparison of the two tests of this engine seems to indicate that with the same steam pressure the water pressure at the engine will vary directly as the hydrant or supply pressure is increased or diminished.

On the first trial the openings through the grate were so large that a large quantity of coal was wasted and grates with smaller spaces between the bars were substituted before the second trial.

ENGINE RELIEF D.

Calculated capacity at 300 revolutions per minute 562 gallons. Tested November 6, 1893.

The engine was started at 1.23–40 P.M., and after running 4 minutes with one 500-foot line of $2\frac{1}{2}$-inch hose with a $1\frac{1}{4}$-inch nozzle a second 500-foot line with a $1\frac{1}{8}$-inch nozzle was added, and with the exception of one minute when one line was shut off to stop a leak at a coupling these conditions were continued for 89 minutes 20 seconds with an average steam pressure of 77.5 lbs., water pressure at engine 118.3 lbs., and water pressures at nozzles 39 and 51.2 lbs., with a discharge of 561 gallons per minute.

Three-inch hose was then substituted for $2\frac{1}{2}$-inch hose on one of the lines and a run of $18\frac{1}{2}$ minutes was made, using a $1\frac{1}{4}$-inch nozzle on the 3-inch line and a $1\frac{1}{8}$-inch nozzle on the $2\frac{1}{2}$-inch line.

The 3-inch hose with the larger size nozzle gave the larger nozzle pressure and a discharge about 30 per cent greater than the same length of $2\frac{1}{2}$-inch hose. From 3.16 to 3.26 P.M. the nozzle on the $2\frac{1}{2}$-inch hose gave the larger pressure, probably caused by the partial closing of a valve on the discharge of the 3-inch line. With a $1\frac{1}{2}$-inch nozzle connected with a single line of 3-inch hose 500 feet in length the discharge was about 478 gallons, while the same nozzle siamesed from two 500-foot lines of $2\frac{1}{2}$-inch hose gave a discharge of 533 gallons per minute.

With two 200-foot lines siamesed into a $1\frac{3}{4}$-inch nozzle a discharge of 674 gallons per minute, with a nozzle pressure of 51.7 lbs., was maintained for 8 minutes 5 seconds.

Indicator cards showing the pressure in the steam cylinders were taken at intervals of about 10 minutes, and from these observations the following results have been deduced.

Time. P.M.	Revs. per min.	Total indicated horse power.	Horse power, pump measurement.	Per cent of indicated horse power.
1.35	312	29.35	26.0	88.6
1.45	324	35.00	29.8	85.2
1.55	318	34.26	30.0	87.5
2.15	306	29.71	25.8	87.0
2.25	303	28.88	24.9	86.3
2.35	318	32.12	28.6	89.0

Engine No. 14.

Calculated capacity at 300 revolutions per minute 594 gallons. Tested October 25, 1893.

From 1.15 to 1.52–30 P.M., or for 37 minutes 10 seconds, two lines of $2\frac{1}{2}$-inch hose each 400 feet in length, with $1\frac{1}{8}$-inch nozzles, were used, with an average steam pressure of 79.2 lbs., average water pressure at the engine 108.5 lbs., and at the nozzles 46.5 lbs., giving a discharge of 512 gallons per minute. By closing a gate on the supply main the pressure at the hydrant was reduced from 38 to 18 lbs. for 12 minutes with a reduction of 5 lbs. in the boiler pressure, and the water pressure at the engine was reduced 16 lbs.

A run of 52 minutes was then made using two 400-foot lines of hose, with nozzles $1\frac{1}{4}$ and $1\frac{1}{8}$ inches in diameter.

Under these conditions the average steam pressure was 78.3 lbs., water pressure at the engine 104.8 lbs., and the discharge 528 gallons per minute. With a single line of hose 600 feet in length, with a $1\frac{1}{4}$-inch nozzle, 325 gallons per minute were discharged. Two 500-foot lines of $2\frac{1}{2}$-inch hose with siamese coupling and a $1\frac{1}{2}$-inch nozzle gave a pressure of 45 to 49 lbs. at the nozzle and a discharge of about 490 gallons per minute.

Using two 200-foot lines of $2\frac{1}{2}$-inch hose with a $1\frac{3}{4}$-inch nozzle, a discharge of between 575 and 600 gallons per minute was maintained for a short time, but the steam pressure could not be maintained while running at this speed.

Engine No. 27.

Calculated capacity at 300 revolutions per minute 619 gallons. Tested October 24, 1893.

The test was commenced at 1.23–30 P.M., using $1\frac{1}{4}$ and $1\frac{1}{8}$ inch nozzles with 500-foot lines of $2\frac{1}{2}$-inch hose.

These conditions were maintained for $41\frac{1}{2}$ minutes, the average steam pressure during this time being 62.7 lbs., the water pressure at the engine 110.3 lbs., and at the nozzles 34 and 43.2 lbs., with a discharge of 520 gallons per minute. A run of $37\frac{1}{2}$ minutes was then made with the same lengths of hose and two $1\frac{1}{8}$-inch nozzles. Trouble was experienced in maintaining the steam pressure, and at 2.42–45 P.M. the engine was stopped for $6\frac{3}{4}$ minutes for the purpose of cleaning the fire.

The engine was then run for $55\frac{3}{4}$ minutes, pumping through a single line of hose with a $1\frac{1}{4}$-inch nozzle. Under these conditions the average steam pressure was 79.8 lbs.,

the water pressure at the engine 187.7 lbs., at the nozzle 57.7 lbs., with a discharge of 356 gallons per minute. Two trials were then made using a $1\frac{3}{4}$-inch nozzle siamesed from two 200-foot lines of $2\frac{1}{2}$-inch hose.

In both instances a discharge of 600 gallons per minute was maintained for a few minutes, but the steam pressure could not be maintained. As in the case of Engine No. 23, tested October 30, an examination showed that there were leaks around the tubes in the upper head of the boiler which cut off the draft.

These were repaired and a second test was made on November 3, 1893.

Second test of Engine 27.

The engine was started at 1.06 P.M. After pumping for $19\frac{1}{2}$ minutes through two 500-foot lines of $2\frac{1}{2}$-inch hose with $1\frac{1}{8}$-inch nozzles discharging during the last $16\frac{1}{2}$ minutes 587 gallons per minute, a $1\frac{1}{4}$-inch nozzle was substituted on one of the lines, and these conditions were maintained for an hour.

At 2.12 P.M. a change was made in the fireman, and in 12 minutes the pressure of steam dropped from 85 lbs. to 30 lbs., necessitating the shutting off of one of the lines for 4 minutes.

Fireman No. 1 took charge of the fire and ran until 2.41 P.M.

At 2.39–30 P.M. $1\frac{1}{4}$-inch nozzles were placed on both lines.

After 2.41 P.M., Fireman No. 2 being in charge of the boiler, the steam pressure dropped from 80 to 20 lbs. in 9 minutes and the engine was shut down. A change was again made in the fireman, and from 2.51–15 to 3.08–50 P.M. the average steam pressure was 104.7 lbs., the water pressure at the engine being 134 lbs., at the nozzles 40.7 lbs., with a discharge of 596 gallons per minute.

Three-inch hose was then substituted for $2\frac{1}{2}$-inch in one line, and a test was made which well illustrates the benefit derived from the use of the larger-sized hose. With hose of the same length and nozzles of the same diameter the pressure at the nozzle of the 3-inch hose was 15.7 lbs. greater than at the nozzle of the $2\frac{1}{2}$-inch line, and the discharge was about 20 per cent. greater.

This test was followed by a run of $16\frac{1}{3}$ minutes, using a $1\frac{1}{2}$-inch nozzle siamesed from two 500-foot lines of $2\frac{1}{2}$-inch hose.

During this time 566 gallons per minute were discharged, and an average steam pressure of 75.5 lbs. was maintained.

With a nozzle $1\frac{3}{4}$ inches in diameter connected with two 200-foot lines of $2\frac{1}{2}$-inch hose a discharge of 700 gallons per minute was maintained for about 12 minutes, but the boiler would not continue to supply steam in sufficient quantity to maintain the speed required, which was from 340 to 360 revolutions per minute.

Calorimetric tests of the amount of moisture in the steam, made during the first trial of this engine, gave an average of 1.63 per cent. moisture.

Engine No. 43.

Calculated capacity at 300 revolutions per minute 525 gallons. Tested October 20, 1893.

The engine was started at 12.54 P.M., using two 400-foot lines of $2\frac{1}{2}$-inch hose with $1\frac{1}{8}$-inch nozzles. At 1 P.M. a piezometer coupling attached to the discharge outlet on the steamer blew off and 4 minutes were lost in reconnecting hose.

The engine was then run for 48 minutes with a steam pressure of 73.2 lbs., with water pressure at the engine of 115.7 lbs., and at the nozzles 54.7 lbs. With the same lengths of hose and $1\frac{1}{4}$-inch and $1\frac{1}{8}$-inch nozzles a run of about an hour was then made.

The lengths of the lines of hose was then increased from 400 to 500 feet and two $1\frac{1}{8}$-inch nozzles used for 26 minutes 50 seconds, giving an average steam pressure of 75.2 lbs., water pressure at the engine 122.5 lbs., and at the nozzles 50.7 lbs., equal to a discharge of 536 gallons per minute. The test was finished with a run of 24 minutes using a $1\frac{1}{4}$-inch ring nozzle on one line and a $1\frac{1}{8}$-inch smooth nozzle on the other. In this case the smaller nozzle discharged the greater quantity of water, although the nozzle pressure was greater at the ring than at the smooth nozzle.

On November 16th a test was made to determine the capacity of this engine when drafting from a tank. The water was raised from 12.5 to 13.5 feet and delivered through 500-foot lines of hose. Nozzles $1\frac{1}{8}$ inches in diameter were used during the run of 26 minutes 10 seconds, interrupted for 2 minutes 10 seconds by the breaking of an oil-cup connection on the steam-pipe.

During the first half of the run the steam pressure was 98.2 lbs., the water pressure at the engine 93.1 lbs., and at the nozzles 38.5 lbs., while during the latter portion of the run the steam pressure was 87.5 lbs., the water pressure at the engine 87.1 lbs., and at the nozzles 33.5 lbs.

During the above tests the engine did not work smoothly

nor efficiently, and it was discovered that air was leaking into the suction through the relief valve. After this had been stopped a 16-minute test was made with the same nozzles and lengths of hose, and with a steam pressure of 109.3 lbs., the water pressure at the engine was 116.5 lbs., and at the nozzles 47.2 lbs., discharging 517 gallons per minute. With nozzles $1\frac{1}{4}$ inch and $1\frac{1}{8}$ inch in diameter the results were as follows: average steam pressure 105.9 lbs., water pressure at the engine 112.4 lbs., at the nozzles 37.5 and 48.2 lbs., discharging 547 gallons per minute.

With 1,000 feet of $2\frac{1}{2}$-inch hose and a $1\frac{1}{8}$-inch nozzle 60.2 lbs. nozzle pressure was given, with a water pressure of 215.7 lbs. at the engine. With the same length of hose and a $1\frac{1}{4}$-inch nozzle, the nozzle pressure was 43 lbs. and the discharge 308 gallons per minute.

ENGINE NO. 21.

Calculated capacity at 300 revolutions per minute 524 gallons. Tested November 9, 1893.

This engine is a duplicate of Engine No. 43. The first test was made with two lines of $2\frac{1}{2}$-inch hose each 500 feet in length, with nozzles $1\frac{1}{4}$ and $1\frac{1}{8}$ inches in diameter. For a few minutes a steam pressure of 100 lbs. was maintained, but it fell rapidly, and after a run of $14\frac{1}{4}$ minutes one line was shut off for 3 minutes in order to raise the steam pressure. The second line was again let on and for 48 minutes 35 seconds the average steam pressure was 89.4 lbs., the water pressure at the engine 124.7 lbs., with a discharge of 575 gallons per minute. Two $1\frac{1}{8}$ inch nozzles were then used for 41 minutes, the average steam pressure being 90.7 lbs., the water pressure at the engine 140.2 lbs., at the nozzles 60 lbs., with a discharge of 582 gallons per minute. A second trial of 24 minutes 10 seconds, using $1\frac{1}{4}$-inch and $1\frac{1}{8}$-inch nozzles, was then made, during which a very uniform steam pressure of 112 lbs. was maintained, giving a water pressure at the engine of 138 lbs. and a discharge of 607 gallons per minute. Three short runs were made using a $1\frac{1}{4}$-inch nozzle; in the first case $2\frac{1}{2}$-inch hose was used, in the second trial 3-inch hose fitted with a bushing of the size of $2\frac{1}{2}$-inch couplings, in the third test 3-inch hose with 3-inch couplings.

The tests resulted as follows:

	Steam pressure in boiler. Lbs.	Water pressure at engine. Lbs.	Water pressure at nozzle. Lbs.	Discharge per minute. Gallons.
$2\frac{1}{2}$-inch hose	107.9	221.4	75.5	407
3 " " $2\frac{1}{2}$-inch couplings .	114.9	219.5	101 5	472
3 " " 3 " " .	118.8	217.5	105.0	479

With two 500-foot lines of $2\frac{1}{2}$-inch hose siamesed into a $1\frac{1}{2}$-inch nozzle the average steam pressure during a run of 11 minutes 25 seconds was 102.3 lbs.. the water pressure at the engine being 152.8 lbs., and at the nozzle 68 lbs , with a discharge of 576 gallons per minute.

Engine No. 7.

Calculated capacity at 300 revolutions per minute 691 gallons. Tested October 19, 1893.

The engine was started at 1.26-20 P.M. and run until 2 P.M. with a steam pressure of 51 lbs., water pressure at the engine 98.4 lbs., using two 400-foot lines of hose with $1\frac{1}{8}$-inch nozzles.

The steam pressure was then raised to 70 lbs., and with the same conditions of hose and nozzles for 19 minutes the water pressure at the engine was 124.2 lbs., and at the nozzles 57 lbs.

A $1\frac{1}{4}$-inch nozzle was substituted on one line, and during a period of 24 minutes, with steam at 65.2 lbs., the water pressure was 119.6 lbs. at the engine and the discharge was 581 gallons per minute.

The steam pressure was then raised to 85 lbs., and for 45 minutes an average water pressure of 147 lbs. was maintained at the engine, giving a discharge of 640 gallons per minute.

With a $1\frac{3}{4}$-inch nozzle, using two 200-foot lines of $2\frac{1}{2}$-inch hose, a discharge of 725 gallons per minute was maintained for 9 minutes, and with a 2-inch nozzle the discharge for 12 minutes was at the rate of 697 gallons per minute.

Engine No. 15.

Calculated capacity at 300 revolutions per minute 957 gallons. Tested November 13, 1893.

This engine is a type of the largest capacity engines in use in the city. During the first test of 64 minutes 10 seconds' duration three 500-foot lines of hose were used, two of them $2\frac{1}{2}$ inches in diameter with $1\frac{1}{8}$-inch nozzles, and one 3 inches in diameter with $1\frac{1}{4}$-inch nozzle.

With a steam pressure of 107.4 lbs., pressures of 53.5 lbs. were obtained at the $1\frac{1}{8}$-inch nozzles and 55.7 lbs. at the $1\frac{1}{4}$-inch nozzle, giving a total discharge of 900 gallons per minute.

The engine was shut down for 26 minutes to repair a broken boiler feed-pipe. Four lines were then attached, and with three $1\frac{1}{8}$-inch nozzles and one $1\frac{1}{4}$-inch nozzle the dis-

charge was 978 gallons per minute. With three 200-foot lines of $2\frac{1}{2}$ hose siamesed into a $1\frac{3}{4}$-inch nozzle, and a 500-foot line of 3-inch hose supplying a $1\frac{1}{8}$-inch nozzle, the average steam pressure for 11 minutes 50 seconds was 98.2 lbs., with the water pressure at the engine 96.6 lbs., giving a discharge of 1,022 gallons per minute.

Three 200-foot lines of $2\frac{1}{2}$-inch hose and one 450-foot line of 3-inch hose siamesed into a 2-inch nozzle gave for $12\frac{1}{2}$ minutes, with a steam pressure of 95.3 lbs., a discharge of 989 gallons per minute. Indicator cards showing the pressure in the steam cylinders were taken at frequent intervals, from which the horse power developed has been calculated.

Time. P.M.	Revolutions per minute.	Total indicated horse power.	Horse power, pump measurement.	Per cent. of indicated horse power.
1.38	294	84.86	64.9	76.5
1.48	300	84.15	60.9	72.4
1.57	304	85.88	60.9	70.9
2.05	294	Missed		
2.20	262	59.75	41.2	69.0
2.27	294	83.21	57.8	69.4
3.00	315	61.68	40.2	65.1
3.09	326	79.46	47.7	60.0
3.14	348	85.05	47.6	56.0
3.21	336	85.98	53.2	61.9
3.27	330	59.41	43.9	74.0
3.45	346	83.90	54.4	64.9
3.50	334	74.55	46.3	62.2
4.10	332	84.31	56.0	66.4

Calorimetric tests of the amount of moisture in the steam gave an average of 1.80 per cent. moisture.

ENGINE NO. 42.

Tested October 26, 1893.

For about one hour water was discharged from two $1\frac{1}{8}$-inch nozzles, using 400-foot lines of $2\frac{1}{2}$-inch hose.

The averages for $50\frac{1}{2}$ minutes were: steam pressure 78.9 lbs., water pressure at engine 101.6 lbs., at the nozzles 46.5 lbs., with a discharge of 515 gallons per minute. Substituting a $1\frac{1}{4}$-inch nozzle on one line a run of 37 minutes 50 seconds, with an average steam pressure of 74.5 lbs., gave a water pressure at the engine of 102.2 lbs., at the nozzles 38.0 and 48.5 lbs., with a discharge of 550 gallons per minute. With a 500-foot line of 3-inch hose with a $1\frac{1}{4}$-inch nozzle the water pressure at the engine for $9\frac{1}{3}$ minutes was

86.4 lbs., at the nozzle the pressure was 71 lbs., and the discharge 395 gallons per minute. With $1\frac{1}{8}$-inch nozzles, the same sizes used during the first test, but with one 3-inch and one $2\frac{1}{2}$-inch line of hose, the lines being 100 feet longer than before, a 12-minute run gave an average steam pressure of 71.2 lbs., water pressure at engine 96.8 lbs., and a discharge of 502 gallons per minute.

Using a $1\frac{1}{2}$-inch nozzle with 500 feet of 3-inch hose 441 gallons per minute were discharged with a nozzle pressure of 40 lbs.

With 500 feet of $2\frac{1}{2}$-inch hose and a $1\frac{1}{4}$-inch nozzle the pressure at the nozzle was 48.5 lbs., giving a discharge of 327 gallons per minute for 10 minutes. With the same length of 3-inch hose with same pressure at the engine the discharge was about 30 per cent. greater and the nozzle pressure 20 lbs. more.

The test concluded with a run of 11 minutes, using one 500-foot line of $2\frac{1}{2}$-inch hose with a $1\frac{1}{8}$-inch nozzle, and one 500-foot line of 3-inch hose with a $1\frac{1}{4}$-inch nozzle, and in this case the pressure at the $1\frac{1}{4}$-inch nozzle was 4.5 lbs. larger and the discharge 30 per cent. more than from the $2\frac{1}{2}$-inch hose.

Engine No. 23.

Tested October 30, 1893.

The first run was made using 500-foot lines of hose and $1\frac{1}{8}$-inch nozzles. For $27\frac{1}{2}$ minutes the average steam pressure was 72.8 lbs., water pressure at the engine 104.0 lbs., and at the nozzles 41.5 lbs., with a discharge of 484 gallons per minute.

Run No. 2 with the same lines of hose, but with $1\frac{1}{4}$-inch and $1\frac{1}{8}$-inch nozzles, gave for 37 minutes an average steam pressure of 55.2 lbs., water pressure at engine 86.4 lbs., nozzle pressures of 27.5 and 32.75 lbs., and a discharge of 460 gallons per minute.

During this run difficulty was experienced in maintaining the steam pressure, and at 2.26 P.M. one line of hose was shut off and for about 30 minutes one 500-foot line of $2\frac{1}{2}$-inch hose was used with $1\frac{1}{4}$-inch nozzle. For $14\frac{1}{2}$ minutes of this time the average steam pressure was 53.0 lbs., water pressure at the engine 124.1 lbs., water pressure at the nozzle 39.75 lbs., and for the last $12\frac{1}{2}$ minutes the average steam pressure was 65.4 lbs., water pressure at the engine 157.4 lbs., and at the nozzle 51.25 lbs.

Another attempt was made to use two lines with $1\frac{1}{4}$ and $1\frac{1}{8}$ inch nozzles, but in 10 minutes the steam pressure dropped from 70 to 35 lbs., and the engine was shut down

and the fire drawn from under the boiler. After washing out the tubes a new fire was built and another attempt made to run the engine under the same conditions, but the steam pressure could not be maintained above 60 lbs., and after running for 40 minutes the trial was ended.

An examination and water-pressure test of the boiler made after the trial showed that there were leaks around the tubes in the upper head of the boiler. These leaks cut off the draft so that steam could not be made in sufficient quantity.

These leaks were repaired and a second trial was made on November 1.

2d Test of Engine 23.

Two 500-foot lines of $2\frac{1}{2}$-inch hose with nozzles $1\frac{1}{8}$ inch and $1\frac{1}{4}$ inch in diameter were used. The engine ran for 49 minutes, when it was disabled by the breaking of a small tooth in one of the rotary cams in the steam cylinder. During a period of $43\frac{1}{2}$ minutes the average steam pressure was 91.4 lbs., water pressure at the engine 136.6 lbs., and the discharge 590 gallons per minute. With the same conditions of hose and nozzles the steam pressure was from 35 to 40 lbs. more than could be obtained at the previous trial.

ENGINE NO. 33.

Tested October 31, 1893.

This engine was a duplicate of Engine No. 23. For 4 minutes 40 seconds two 500-foot lines of $2\frac{1}{2}$-inch hose with $1\frac{1}{8}$-inch nozzles were used. The average steam pressure being 88.4 lbs., water pressure at engine 139.69 lbs., and at the nozzles 60 lbs., discharging 582 gallons per minute. A $1\frac{1}{4}$-inch nozzle was then substituted on one line and for 21 minutes, with the average steam pressure at 79.7 lbs., the water pressure at the engine was 141.1 lbs. and the discharge 612 gallons per minute.

With 500-foot lines of hose and two $1\frac{1}{4}$-inch nozzles an average steam pressure of 70.7 lbs. was kept up for $41\frac{1}{2}$ minutes, giving a water pressure of 127.6 lbs. at the engine and 42.5 lbs. at the nozzles, with a discharge of 611 gallons per minute. At 2.27–30 P.M. a coupling on the pump relief pipe broke and the test was interrupted for $17\frac{1}{2}$ minutes while temporary repairs were being made. A run of 17 minutes 20 seconds was then made with hose and nozzles the same as before the accident, the average steam pressure being 78.9 lbs., water pressure at the engine 120.2 lbs., at the nozzles 40.2 lbs., with a discharge of 594 gallons per minute.

Three-inch hose was then substituted for $2\frac{1}{2}$-inch on one line

and for $19\frac{1}{2}$ minutes the average steam pressure was 82.6 lbs., the water pressure at the engine 124.5 lbs. Although the nozzles were of the same size the gauge upon one showed a pressure 14.5 lbs. larger than the other and a discharge of 14 per cent. greater in favor of the 3-inch hose.

At 3.27–30 P.M. the engine suddenly stopped while running at the rate of about 800 revolutions per minute, and on examination two of the teeth of the rotary steam-cam were found to be broken in a similar manner to those of Engine No. 23.

Test of the Water-Tower.

A test of the Hale Water-Tower was made on November 17, water being supplied to the tower by Engines 15, 43, and Relief D.

Water pressures were taken at the steamers, at piezometers attached to the hose connections on the tower, at a gauge connected with the supply-pipe at the base of the tower and at the nozzle.

In order to make the nozzle gauge accessible for taking the pressures, the tower was not raised, and in actual service the pressures at the base of the tower and at the steamers would be about 25 lbs. more than the figures given in the tables in order to obtain the same effective pressures at the nozzle.

The trial developed the fact that there was a great loss of pressure due to the friction through the $3\frac{1}{2}$-inch hose between the base of the tower and the nozzle. With a 2-inch nozzle discharging 1,000 gallons per minute with a pressure of 57 lbs. at the nozzle a pressure of 107 lbs. was required at the base of the tower, and in some instances there was a friction loss of 80 lbs. between the base of the tower and the nozzle.

Under these conditions an excessive pressure was required at the engines to give effective pressures at the tower nozzle.

If we assume two engines each connected to the tower by two 300-foot lines of $2\frac{1}{2}$-inch hose, a water pressure of 100 lbs. at the engines would give a pressure of but 30 lbs. on the 2-inch nozzle with the tower raised, and a discharge of 725 gallons per minute.

With a $1\frac{3}{4}$-inch nozzle the pressure would be about 40 lbs., with a discharge of 625 gallons per minute.

An experiment was made to show the effect of connecting one line from a steamer to the tower with a second line supplying a $1\frac{1}{4}$-inch nozzle. The small differences between the pressures at the steamer and the piezometer connections

at the tower show that the greater part of the amount pumped by the steamer was discharged from the $1\frac{1}{4}$-inch nozzle.

Changes are now being made in the tower to increase its efficiency, and it is proposed to make a second test after the improvements have been made.

The accompanying table gives the details of the test made on November 17.

CAPACITY OF HYDRANTS.

During all the tests, except when drafting, the engines were attached to a Post hydrant which was located at the end of an 8-inch pipe, 240 feet long, connected with a 12-inch main in Albany street.

The hydrant, as before described, had an inside diameter of $6\frac{3}{4}$ inches, a 6-inch rubber valve, and three outlets for hose connections, each controlled by an independent valve. Two of these outlets were $4\frac{1}{2}$ inches, the other $2\frac{1}{2}$ inches in diameter.

Pressures were taken on the 8-inch pipe at the base of the hydrant and on a piezometer attached to the steamer suction, in order to determine the loss of pressure in passing through the hydrant.

These experiments show that the friction loss in the hydrant was 4 lbs. for a discharge of 500 gallons per minute and 16 lbs. for a discharge of 1,000 gallons, also that a large proportion of the total loss is in the outlet valve.

During the trial of the water-tower, all three of the engines used were for a portion of the time connected with this Post hydrant, and the lowest pressure taken at the piezometer coupling was 20 lbs., showing that hydrants of this pattern will furnish an ample supply for three steamers. Owing to the lateness of the season, the experiments on the capacity of hydrants were not completed and no tests were made of the friction loss in the $2\frac{1}{2}$-inch reducers which are used on the engine suctions.

FRICTION IN HOSE.

The experiments were not conducted with special reference to obtaining information on this point, but in general they confirm the more careful experiments made by Mr. John R. Freeman and reported in a paper presented by him to the American Society of Civil Engineers.

Experiments were, however, made to show the comparative value of $2\frac{1}{2}$-inch and 3-inch hose and the effect of using $2\frac{1}{2}$-inch couplings on the 3-inch hose.

Table showing the comparative efficiency of $2\frac{1}{2}$-inch and 3-inch hose. Lines in all cases 500 feet in length.

Number of experiment.	Diameter of discharge nozzles.	Water pressures in lbs. At steamer.	At nozzle. 3-in. hose.	At nozzle. $2\frac{1}{2}$-in. hose.	Discharge in gallons. 3-in. hose.	Discharge in gallons. $2\frac{1}{2}$-in. hose.
1	$1\frac{1}{4}$ in.	128.1	55.0	39.2	347	293
2	$1\frac{1}{4}$ in.	124.5	57.5	43.0	355	307
3	$1\frac{1}{8}$ in.	96.8	50.7	38.5	268	234

In the first three experiments given in the above table, two lines of hose each 500 feet in length were attached to a steamer, and nozzles of the same diameter attached to each line.

With the same pressure at the steamer, the pressures at the nozzles on the 3-inch lines of hose were from 12 to 15 lbs. greater than on the $2\frac{1}{2}$-inch lines. In the fourth and fifth experiments, $1\frac{1}{4}$-inch nozzles were used on the 3-inch hose and $1\frac{1}{8}$-inch nozzles on the $2\frac{1}{2}$-inch. It will be noticed that the effective pressure at the $1\frac{1}{4}$-inch nozzle on the 3-inch hose was as large as at the $1\frac{1}{8}$-inch nozzle on the $2\frac{1}{2}$-inch hose, while the discharge from the nozzles on the 3-inch hose was between 20 and 25 per cent. more.

A comparison of experiments 6 and 8 shows the effect of using $2\frac{1}{2}$-inch couplings on 3-inch hose, and it will be noticed that with the same pressure at the engine, the nozzle pressure is about 5 lbs. less when using the $2\frac{1}{2}$-inch couplings, or for a 500-foot line of hose about $\frac{1}{2}$ lb. loss at each $2\frac{1}{2}$-inch coupling when discharging 475 gallons per minute.

The loss of pressure per 100 feet in the different sizes of hose is approximately as follows:

	250 gallons per minute.	300 gallons per minute.
$2\frac{1}{2}$-in. hose	13 lbs.	18 lbs.
3-in. hose, $2\frac{1}{2}$-in. couplings .	8 lbs.	10.7 lbs.
3-in. hose, 3-in couplings .	8 lbs.	10.5 lbs.

The advantage of using 3-inch hose is illustrated by the following example: with a steamer using a line of hose 600 feet in length, with a $1\frac{1}{4}$-inch smooth nozzle discharging 300 gallons per minute, a quantity none too large for the needs of the present fire-service, a water pressure of 150 lbs. at the steamer would be required if $2\frac{1}{2}$-inch hose were used, while with 3-inch hose the same results would be attained with a pressure of 105 lbs. at the steamer.

The advantage of the use of $2\frac{1}{2}$-inch couplings would be that no time would be lost in attaching reducing couplings or in finding hose of the needed size, while the loss of pressure due to the $2\frac{1}{2}$-inch couplings would be insignificant in ordinary use.

Without doubt the 3-inch hose is not so easily handled on ladders or in buildings, but great benefit could be derived by using from 300 to 500 feet of 3-inch hose from the steamer, with one or two lengths of $2\frac{1}{2}$-inch hose attached for the hoseman's use.

GENERAL RESULTS AND CONCLUSIONS.

The following tables, condensed from the tables giving the details of the tests, show, in a convenient form, the results obtainable from the different steamers tested.

Table No. 2 gives the length of the trials, average steam and water pressure at the engine, the quantities pumped, coal used, water evaporated, etc.

Table No. 3 gives the results obtained by each engine under different conditions of steam pressure, length of hose, diameter of nozzles, etc., with the time during which the engine was operated under those conditions.

It will be seen from an inspection of column 9 of Table No. 2 and column 4 of Table No. 3, that engines Nos. 36, D, 21, 43, and 15 equalled or exceeded their calculated capacity at 300 revolutions per minute for runs of from 35 to 89 minutes, and that the average amount pumped per minute by Engines 21, 36, and 43, for the whole time while the pumps were working, was in excess of their calculated capacity.

The tests also show that the smallest-size engines in use in the department are capable of delivering through 500-foot lines of hose two good fire streams, and that the large-size Clapp & Jones engines will deliver from 900 to 975 gallons per minute, equal to three good $1\frac{1}{4}$-inch streams.

It must be remembered that in all cases the engines tested drew their water-supply from a hydrant under a pressure of from 30 to 40 lbs., and that the steamers of the

same class would not be able to deliver as powerful streams if obliged to draft their supply.

This statement is verified by the results of tests of Engines 36 and 43.

I wish to call your attention to the desirability of using two lines of hose with siamese connections in cases where the steamers are so located that lines more than 500 feet in length are required to reach a fire, or where very powerful streams are needed.

Take the case of Engines 36 or 21, the smallest size in use by the department, with a single line of $2\frac{1}{2}$-inch hose 800 feet long, a water pressure of 150 lbs. at the engine would give, with a $1\frac{1}{4}$-inch nozzle, a pressure of but 30 lbs. at the nozzle, while the same engine pressure, using two lines of the same length siamesed into a 50-foot line with a $1\frac{3}{8}$-inch nozzle, a nozzle pressure of 55 lbs. would be obtained. In the first case, the discharge would be about 250 gallons per minute, and the stream would not be effective above the third story, while in the latter case a stream discharging 425 gallons per minute would be available 80 feet above the ground.

The results given in regard to the coal burned and water evaporated by the boilers confirms what was noticed during the trials, viz., that steam was more easily made and maintained by the Clapp & Jones boilers than by those of the Amoskeag engines.

The evaporation per pound of coal from and at 212 degrees varied from 2.26 lbs. in the case of Engine No. 36 to 5.87 lbs. for Engine No. 43.

The slip, or loss through the valves and pistons of the pumps, varied from 3 to 8 per cent. of the calculated displacement of the pump plungers.

Engines Nos. 36 and 43 showed a loss of about 5 per cent. when taking their supply from the hydrant, and 8 per cent. when drafting.

The question is sometimes raised as to whether the supply of water at the hydrants is sufficient for the supply of the steamers.

It seems to me that the engineers would have more positive information on this point, if a combined pressure and vacuum gauge were attached to the suction chamber of all engines. This plan has been adopted in Detroit with good results.

The statements, which have been made on a previous page, in regard to the advantages of using 3-inch hose, are applicable in the consideration of the desirability of placing 3 or 4 inch iron stand-pipes on the outside of all high buildings for the use of the Fire Department.

A considerable number of these pipes have been placed upon buildings by property owners, but they are not under the control of the Fire Department, are sometimes not furnished with proper hose connections, often are not put up in connection with fire-escapes, and are not as efficient an aid to the department as they should be.

These stand-pipes should be erected under the supervision, and be placed under the inspection and control, of the Fire Department.

The appended tables give full details of the experiments, and, as much care was taken to avoid errors in the observations, it is thought that they will have much value for the purpose of comparison with future records of a similar character.

I desire to extend my thanks to the members of the Fire Department, who have given me many valuable suggestions and great assistance during the progress of the trials.

Yours respectfully,

WILLIAM JACKSON,
City Engineer.

[1] Shut down to remove strainer and change nozzle. [2] Started to let fire run down.
[3] At 3.44 P.M. pulled fire and changed the size of the exhaust from 2 tips each $1\frac{1}{8}$ in. to 15-16 in. by plugging with wedges.
[4] At 3.50 P.M. started new fire. [5] At 3.58 P.M. started pumps again. [6] Shut down to change hose, etc.

Duration of test, 3 h. 18 min. 30 sec.
Length of time that pumps were running, 2 h. 59 min. 55 sec.
Total pounds coal used, 2,071.
Total pounds water evaporated, 6,188.

[1] Started new fire.
[2] Started pumps at 1.05-30 P.M.
[3] Shut down for 20 seconds.
[4] Gate on main partially closed.
[5] Gate on main fully opened.
[6] Line No. 1 shut off in order to change nozzle.
[7] Line No. 1 shut off in order to change hose.
[8] Shut down in order to change hose.

Pounds of water evaporated per pound coal, 2.99.
Pounds of water evaporated per pound coal, from and at 212°, 3.57.
Duty in foot-pounds per 100 pounds coal, 5,882,000.
Coal used per square foot of grate per hour, 141.6 lbs..

[9] Shut down in order to equalize lengths of hose.
[10] Shut down to change hose, etc.
[11] Started at 4.06-30 P.M., but had to shut down to tighten hose connections.
[12] At 4.16 P.M. started to run down.
[13] Shut down at 4.22 P.M.

Engine No. 27. Tested October 24, 1893. Style, Amoskeag.

Size, 7.651 in. × 4.50 in. × 7.89 in. Capacity at 300 Revolutions, 619 Gallons.

Duration of test. 1 h. 31 min. 20 sec.
Length of time that pumps were running, 1 h. 10 min. 5 sec.
Total pounds coal used, 864.

Duty in foot-pounds per 100 pounds coal, 8,736,300.
Coal used per square foot of grate per hour, 163.7 lbs.

[1] Started new fire at 10.39 A.M.
[2] The hose having been left out over night it took from 10.39 to 11 A.M. to clear it of ice.
[3] Shut down on account of oil-cup breaking.
[4] Shut down in order to stop air leaking into the suction through the relief valve.

[5] Shut off Line No. 2 in order to change nozzle.
[6] Shut down in order to change hose
[7] Shut down in order to change nozzle.
[8] Shut down.

Engine No. 21. Tested November 9, 1893. Style, Clapp & Jones.

						Average,		92.7	143.0														98,675

Duration of test, 3 h. 23 min. 50 sec.
Length of time that pumps were running, 3 h. 3 min. 55 sec.
Total pounds coal used, 2,103.
Total pounds water evaporated, 6,068.

Pounds of water evaporated per pound of coal, 2.88.
Pounds of water evaporated per pound of coal from and at 212°, 3.45.
Duty in foot-pounds per 100 pounds coal, 9,678,400.
Coal used per square foot of grate per hour, 181.6 lbs.

[1] Shut down in order to raise steam quickly.
[2] 3-in. hose fitted with 2½ in. couplings.
[3] Shut down to shift hose, etc.
[4] Shut down to change hose.
[5] Shut down to raise steam.
[6] 3-in. hose with 3 in. couplings.
[7] Shut down at 4.30 P.M. In this case the steam pressure was not run down to the same point as when the test began.

Duration of test, 2 h. 45 min. 40 sec.
Length of time that pumps were running, 2 h. 31 min. 10 sec.
Total pounds coal used, 1,429.
Total pounds water evaporated, 5,930.

Pounds of water evaporated per pound of coal, 4.15.
Pounds of water evaporated per pound of coal, from and at 212°, 4.94.
Duty in foot-pounds per 100 pounds coal, 10,201.600.
Coal used per square foot of grate per hour, 117.3 lbs.

[1] Started new fire at 1.22 P.M.
[2] Started pumps at 1.26-20 P.M.
[3] Line No. 1 shut off to change nozzle.
[4] In coaling, kept door open so long that pressure fell.
[5] Shut down in order to change nozzles, etc.
[6] Shut down in order to change nozzle.
[7] Shut down at 4.12 P.M. with steam at same pressure as when the test began.

Engine No. 15. Tested November 13, 1893. Style, Clapp & Jones.

Size, 9.005 in. × 5.49 in. × 8 in. Capacity at 300 Revolutions, 957 Gallons.

Pounds of water evaporated per pound coal, 3.16.
Pounds of water evaporated per pound coal, from and at 212°, 3.76.
Duty in foot-pounds per 100 lbs. coal, 7,265,000.
Coal used per square foot of grate per hour, 148.4 lbs.

[6] Shut down in order to repair a coupling on pump relief pipe.
[7] Line No. 2 shut off in order to change hose.
[8] At 3.27-30 P.M. engine stopped suddenly, and after an examination two of the small teeth of steam cam were found to have broken.

FIRES AND ALARMS

FROM

FEBRUARY 1st, 1893, TO JANUARY 31st, 1894.

FEBRUARY.

Wednesday, 1st, 2–45 A.M. Box 18.

No. 11 Brattle st. Owned by Goodwin & Rimbach; loss, $25; insurance, $12,500; occupied by Goodwin & Rimbach, as hotel; originated in basement; cause, careless use of pipe in clothing.

Wednesday, 1st, 8–01 A.M. Box 67.

No. 9 Burroughs pl. Owned by Homœopathic Medical Dispensary; loss, $260; insurance, $5,000; occupied by Julia A. Raney, as dwelling; loss, $160; insurance, $600; originated in basement; cause unknown.

Wednesday, 1st, 10–15 A.M. Box 428.

No. 87 Decatur st. Owned by M. J. Doran; loss, $10; insurance, $2,000; occupied by M. J. Doran, as provisions; insurance, $1,000; originated in basement; cause, gas explosion.

Wednesday, 1st, 5–17 P.M. Still.

No. 47 Wareham st. Automatic alarm, needless.

Wednesday, 1st, 5–50 P.M. Box 39.

No. 175 Tremont st. Owned by James L. Little estate; loss, $1,582; insurance, $100,000; occupied by A. V. Doyle, as millinery; loss, $1,824; insurance, $3,000; occupied by Miss Chenet, as music rooms; loss, $50; insurance, $300; occupied by H. H. Litchfield, as real-estate office; loss, $100; insurance, $2,000; occupied by M. L. McKean *et al.*, as milliner, etc.; loss, $170; insurance, $34,700; originated on 5th floor; cause, careless use of matches.

Wednesday, 1st, 6–10 P.M. Box 636.

Nos. 159 and 161 Havre st. No. 159 owned by Edward Kenney; loss, $40; insurance, $1,000; No. 161 owned by Sarah McGivern; loss, $34; insurance, $1,600; No. 159 occupied by M. E. Gagen, as dwelling; No. 161 occupied by Sarah McGivern, as dwelling; insurance, $400; originated in basement; cause unknown.

Wednesday, 1st, 8–19 P.M. Box 65.

No. 55 Broadway extension. Owned by S. A. Way estate; occupied by E. Mann, as bottle dealer; originated on 1st floor; cause, overheated stove-pipe.

Wednesday, 1st, 11–42 P.M. Box 29.

False alarm.

Thursday, 2d, 11-27 A.M. Still.

No. 66 ALLEN ST. Owned by D. G. Gilbert; insurance, $1,000; occupied by K. Campbell, as dwelling; originated in basement; cause, hot ashes igniting woodwork.

Thursday, 2d, 2-40 P.M. Box 53.

BOYLSTON AND WASHINGTON STS. Cause, electric motor igniting car of West End Railroad.

Thursday, 2d, 9-09 P.M. Box 7.

No. 35 ALLEN ST. Owned by H. L. Eisner; occupied by Sarah Ingles, as dwelling; originated in basement; cause, hot ashes in wooden receptacle.

Friday, 3d, 0-10 P.M. Still.

No. 44 HOWARD ST. Owned by W. E. Bicknell; loss, $20; insurance, $6,000; occupied by Somerset Clothing Co , as clothing store; loss, $60; insurance, $4,000; originated on 2d floor; cause, gas jet igniting woodwork.

Friday, 3d, 3-30 P.M. Box 13.

No. 3 LOTHROP PL. Owned by Wm. J. Partridge; loss, $230; insurance, $12,000; occupied by Michael Gagan, as dwelling; loss, $114; insurance, $1,000; originated on 2d floor; cause unknown.

Friday, 3d, 5-13 P.M. Still.

No. 7 CRESCENT PL. Owned by C. Barchaglip; insurance, $4,500; occupied by S. M. Freeman *et al.*, as dwelling; originated on 3d floor; cause, careless use of candle.

Friday, 3d, 8-35 P.M. Still.

IRVINGTON ST. Cause, soot in chimney burning.

Friday, 3d, 9-09 P.M. Box 121.

No. 132 A ST. Owned by James Quinn; loss, $192; insurance, $2,500; occupied by James Quinn, as dwelling; loss, $15; originated on 1st floor; cause, careless use of matches.

Remarks. — Hoseman J. F. Hennessey, of Engine No. 15, was slightly injured in the foot with pick of an axe.

Saturday, 4th, 6-07 P.M. Box 35.

No. 252 WASHINGTON ST. Owned by J. A. Codman; loss, $486; insurance, $15,000; occupied by J. A. Cummings Printing Co., as printers; loss, $5,858; insurance, $15,000; originated on 3d floor; cause unknown.

Saturday, 4th, 3-20 P.M. Box 65.

No. 15 MOTTE ST. Owned by S. A. Way estate; insurance, $1,500; occupied by L. Daniels, as tailor shop; insurance, $500; originated on 2d floor; cause unknown.

Sunday, 5th, 8-15 A.M. Box 799.

WILLIAMS COURT. Owned by Boston Herald Co.; occupied by Boston Herald Co., as pressroom; originated in basement; cause, ignition of oily waste from lamp.

Sunday, 5th, 1–33 P.M. Box 68.

No. 699 HARRISON AVE. Owned by A. P. Leary; insurance, $800; occupied by J. Lucas, as provisions; originated on 1st floor; cause, overheated stove.

Sunday, 5th, 3–35 P.M. Still.

No. 24 WEST FIFTH ST. Owned by J. S. Whitney; loss, $5; occupied by Patrick Dillon, as dwelling; originated on 1st floor; cause, thawing water-pipes.

Sunday, 5th, 8–31 P.M. Box 127.

No. 141 WEST SEVENTH ST. Owned by H. Dickmyer; loss, $5; occupied by H. Dickmyer, as dwelling; originated on 1st floor; cause, thawing water-pipes.

Monday, 6th, 1–31 A.M. Still.

No. 131 WEST CHESTER PARK. Cause, soot in chimney burning.

Monday, 6th, 3–51 P.M. Box 966.

No. 1028 WASHINGTON ST. Owned by John G. Karle; loss, $675; insurance, $2,000; occupied by E. A. Coville, as dwelling; loss, $408; insurance, $1,500; originated on 2d floor; cause unknown.

Monday, 6th, 5–40 P.M. Still.

No. 3 ALLSTON ST. Owned by Sargent heirs; insurance, $7,000; occupied by A. J. Williams, as dwelling; insurance, $1,500; originated on 1st floor; cause, ignition of oil from furnace.

Monday, 6th, 6–07 P.M. Box 221.

No. 4 HAMPSHIRE COURT. Owned by Thomas H. Hall; loss, $233; insurance, $2,000; occupied by Mary McGlinn, as dwelling; loss, $10; orginated on 1st floor; cause, thawing water-pipes.

Monday, 6th, 8–33 P.M. Box 339.

GENEVA AVE. Cause, sparks from chimney mistaken for fire.

Tuesday, 7th, 1–30 P.M. Still.

MERCER ST. Owned by Thomas Pray; loss, $20; unoccupied; boat-house; originated on 1st floor; cause, set by boys.

Tuesday, 7th, 7–37, 8–11, 8–13 P.M. Box 51.

NOS. 275 TO 285 CONGRESS ST. Owned by John Dickey; loss, $9,045; insurance, $83,000; occupied by Stearns Shoe Company, as boots and shoes; loss, $10,219; insurance, $83,500; occupied by A. W. Clapp & Co., as boots and shoes; loss, $4,300; insurance, $66,500; occupied by J. H. Bussell & Co., as boots and shoes; loss, $425; insurance, $12,000; occupied by C. E. Riley & Co., as machinery; loss, $6,500; insurance, $38,000; occupied by C. F. Daniels & Co., as slippers; loss, $17,694; insurance, $123,000; occupied by John A. Lowell & Co., as printers; loss, $887; insurance, $7,500; occupied by Haynes, Sparrell & Co., as boots and shoes; loss, $7,062; insurance, $42,000; occupied by Simons, Hatch & Whitten, as storage; loss, $65,818; insurance, $103,000; occupied by Hutchinson & Littlefield, as boots and shoes; loss, $4,089; insurance, $38,000; occupied by J. T. Meader & Co., as hides, etc.; loss, $60; insurance, $12,000. Originated on 6th floor; cause unknown.

Tuesday, 7th, 7–10 P.M. Still.

No. 45 WEST SECOND ST. Owned by J. Costello; occupied by J. Moran, as dwelling; originated on 1st floor; cause, upsetting kerosene lamp.

Tuesday, 7th, 11–51 P.M. Box 61.

No. 238 CABOT ST. Owned by Bishop estate; insurance, $3,000; occupied by John Kenney, as dwelling; originated on 2d floor; cause, breaking kerosene lamp.

Wednesday, 31st, 8-01 P.M. Box 86.

WASHINGTON, NEAR CONCORD ST. Owned by W. E. R.R. Company; occupied by same, as electric car; originated on car; cause, defective motor.

Wednesday, 31st, 10-30 P.M. Box 215.

No. 957 TREMONT ST. Owned by E. Farwell; insurance, $5,000; occupied by Bridget Lang, as dwelling; originated in chimney; cause, soot in chimney.

REPORT OF THE INSPECTOR OF WIRES.

To the Board of Fire Commissioners:

Gentlemen: I have the honor to present to you my annual report for the year ending January 31, 1894. In addition to the work done by this bureau, I have endeavored to obtain for your information an accurate statement from the various companies of this city, as to the extent of their service, and I am pleased to say that with the exception of the Steam and Power Company, all have kindly complied with my request. I desire to again call your attention to the laws governing this department. While it obliges me to examine all wiring for light and power service, and report defects to interested parties, it does not provide for their enforcement. In view of this fact I would suggest that your Board take such action as may be necessary to enable this bureau to more fully carry out the requirements for which it was created. We have received during the year 2,276 notices of installations, which probably is not more than one-half of the amount of work done during that time. As I cannot compel any one to notify us of their intentions, I would recommend that such action be taken as will oblige an inspection and a certificate of approval issued before current is allowed to be used or enter buildings. During the year thirty-six fires have been reported at this office as having been caused by electricity. An immediate examination has been made in each case, and no doubt exists that twenty-three of these reports are correct. Twelve of these places had been examined previous to the fires being reported, and defects noted in eight of them, and the proper parties informed of the same.

Isolated plants have undergone some changes, but most of them still remain in an unsatisfactory condition.

As I have previously reported, overhead wires are run in a very careless manner, and consequently must be a great hindrance to the Fire Department, in many places crossing buildings less than two feet from the roof; and there should be definite regulations controlling this class of work, and a penalty attached for non-compliance to proper rules and regulations.

As a rule new wiring is being done in a satisfactory manner, but the old work is found to be in a very poor condition. This class of work should receive more attention than I am able

to give it with the present force of examiners, their time being fully occupied in looking after new installations. In view of the above fact, I would recommend that your honorable Board consider the advisability of increasing the number of examiners.

Number of buildings examined	2,187
Defects reported	364
Defects remedied	123
Isolated plants examined	135
Arc lights examined	1,424
Incandescent lights examined	67,219
Motors examined	527
Notice of installation received	2,276
Number of buildings from which dead and abandoned wires have been removed . . .	891
Amount of wire removed . . . miles	67
Reports of defective wires received . . .	841
Reports of same sent to owners	504
Number of poles in use by the various companies, independent of the West End Street Railway .	12,048
Plans of streets, showing locations of poles which have been granted by the Board of Aldermen during the year now complete, and filed in this office	781

The Edison Electric Illuminating Company had installed, January 1, 86,631 incandescent lamps, 710 arc lamps, and 1,251 motors, with a total horse-power of 3,999. They have 47 miles of underground conductors. During the past year their overhead system has been entirely removed and replaced with underground.

The Brookline Gas Light Company have overhead wires, all on poles, 52 miles, but none underground. They have in use 2,663 incandescent lamps and 126 arc lamps.

The Church Green Light and Power Company are furnishing current for 2,200 incandescent lamps and 21 electric motors.

The Suburban Light and Power Company have about 90 miles of overhead wire connected with their two stations, and are furnishing current for 275 arc, 7,000 incandescent lamps, and 60 motors. Their wires are mostly on house-tops.

The Boston Electric Light Company are operating five stations in this city, the total horse-power capacity of which is 6,000, with room for extension, as may be needed. They have about 625 miles of overhead wires for arc, incandescent, and power currents. They are engaged at the present

time in laying about 3½ miles of underground wire conduits for the high tension arc current. They have a capacity for 4,000 10 ampère, 45 volt, 2,000 C. P. lamps, of which the city is using about 1,350. They are furnishing some 25,000 16 C. P. alternating incandescent lamps partly to the city and partly to commercial customers, and furnish about 1,000 electrical horse-power to various customers, about 800 of which is from the 500-volt current, the balance from the alternating current.

The Charlestown Gas and Electric Light Company are running one 65-light, one 50-light, nine 30-light dynamos, and one 650-light alternating dynamo, with about 60 miles of overhead wire.

They furnish the city with 140 arc lights, and 113 commercial arc lights and 435 incandescent lights.

West End Street Railway Company have in Boston 75.2 miles of trolley, 105.3 of feeders, and 46.7 overhead returns; in Charlestown, 5.1 miles of trolley, 11.5 of feeders, and 5.5 overhead returns; in Allston and Brighton, 6.4 miles of trolley, 11.7 of feeders, and 3.5 of overhead returns. The Central Power Station capacity in ampères 18,500 — 12,400 horse-power. Allston Power Station capacity in ampères 1,800 — 1,200 horse-power. Charlestown is fed in part from the Cambridge station, which will rate 3,750 electrical horse-power. These are conservative figures and are frequently worked over on station loads.

The New England Telephone and Telegraph Company, the total length of conduit is 24.46 miles; the total length of duct, 201.35 miles; number of manholes, 508.

The underground cables of this company vary from 20 to 200 wires, and the total length of cables is 73.58 miles, while the number of miles of wire underground is 8,361.1.

Western Union Telegraph Company have overhead about 119 miles of wire, and underground about 700 miles, and estimate that 90% of the wires connecting the depots is underground.

Mutual District Messenger Company have about 240 miles of wire on house-tops, but none underground. They have 4,100 call-box connections, and private connections with banks, hotels, City Hall, and State House.

Postal Telegraph Company have 244 miles of overhead wire, and about 40 miles in aerial cables, and are preparing at the present time to petition for the right to put 90% of their wires underground.

Boston District Messenger Company have some 150 miles of overhead wire, and 2,500 call-boxes in this city.

Boston Electric Protective Association have about 15

miles of wire overhead, and enter something over a hundred buildings.

Holmes Protective Company have no wires underground, but are operating about 70 miles of open wire and 35 miles in cables, and enter about 150 buildings.

Boston Auxiliary Fire-Alarm Company have their system installed in 137 buildings in this city and connected with 124 special boxes; 14 of this number of fire-alarm boxes are connected with the central office by two special circuits of about eight miles of overhead wire.

Automatic Fire-Alarm and Extinguisher Company have about 53 miles of overhead wire connecting their office with 232 buildings and 18 engine-houses. One hundred and fifteen fires have been reported by their system, and 49 of them extinguished without the sounding of the city alarm.

United States Electric Fire-Signal Company are operating about 15 miles of overhead wire, connecting 70 buildings, 9 engine-houses, and 57,884 thermostats with their central station.

The above figures are taken from statements submitted this bureau by the several companies at my request.

FIRE-ALARM BRANCH.

New construction in this branch during the past year has been chiefly confined to Dorchester, all the circuits having been rebuilt and two new box circuits and one telephone circuit added to the service, for the purpose of providing greater protection to the district by placing a less number of boxes in each circuit, and altering their connection in accordance with the custom hitherto followed in the construction of all new work in recent years.

The reconstruction of circuits 9, 10, 24, and 38 has been done with new wire throughout, including all loops and drops, and the covered pipe wires used in making connections with the boxes.

The new box circuits are numbered 30 and 31. The telephone circuit has been run to the house of Engine Company No. 19, and is so constructed as to admit of a multiple connection of the instruments which are at present placed in series.

Telephone circuits 5, 6, and 24, running respectively to South Boston, Roxbury, and the South End, and 27, connecting with houses of the Inspector and Deputy Inspector of Wires and chief of the department, have been changed from series to multiple connection, as experience has demonstrated that the efficiency of the service is greatly increased thereby, the interference caused by induction in the lines being almost entirely eliminated.

Telephone circuits 7, 9, 13, 14, 15, 17, 18, and 25 have also been reconstructed and made metallic, and are ready to be connected in multiple as soon as the work can be taken up.

Twenty-one high-resistance generators (one thousand ohms) have thus far been used in the multiple connections.

A new telephone has been placed in the house of Commissioner Murphy and connected with No. 11 circuit.

Circuits 4, 14, 20, 21, 22, 39, and 41 have been reconstructed from City Hall to Pemberton square.

The wires running along the line of Fourth street, from Dorchester to I street, comprising a part of circuits 1, 11, and 42, and telephone circuits 5, 9, and 14, have been renewed and transferred from roof structures to new poles.

Circuits 1, 11, and 42 have also been rebuilt from the corner of Dorchester avenue and Sixth street, to a point at the corner of Eighth and Mercer streets. Circuits 3 and 25 have been extended from Dover to Northampton street on account of rebuilding of Dover-street bridge, and the submarine cable and old wires have been removed from the bridge for the same cause.

Circuits 1, 11, and 42 have been removed from roof fixtures and transferred to a line of poles along Eighth street, from H to L street, new wire being substituted for the old.

New wires have been run on Bunker Hill street, between Lexington and Quincy streets, and connected into circuits 12, 16, 39, and telephone circuit 1. Special circuits have been run from houses of Engines 7 and 15, connecting with call bells at Federal-st. bridge, for the purpose of facilitating their passage over the draw when responding to alarms. The box gong service has been extended to the house of Ladder No. 16, and new mechanical spring-gongs have been substituted for the direct-acting apparatus in the Dorchester houses connected with No. 38 circuit.

A cable containing thirty conductors has been run from the basement of City Hall to the head-room in the dome, connecting with the underground cable and circuits 7, 8, 9, 10, 13, 19, 23, 24, 30, 31, 38, and 44, and telephone circuits 6 and 19 are now working through the same from headquarters to Waltham street. A conduit containing four ducts for underground service has been constructed from Harrison avenue through Bristol street to the new headquarters building, with two manholes for running the cables when desired.

The underground service in the above-named circuits has been successfully carried on during the past year, and arrangements are being made for considerable extension in this

direction in the coming season. Box 54 has been placed on an ornamental street lamp-post on Oxford, near Beach street, and connected into the underground cable at that point. Work is now in progress for establishing several more posts with signal-boxes attached along this line, and it is expected that they will be in service at an early day.

It is intended to further increase the efficiency of the service by making use of telephones in addition to the boxes connected with the underground wires. This will be accomplished by placing the telephones in the lower part of the outside shells and operating them by an independent wire, which will form a circuit entirely distinct from those of the fire alarm, notwithstanding that it will run through the same conduit with them.

The boxes throughout the city have been repainted.

One hundred and one new poles have been set, one hundred and twenty-five old ones painted, and sixty taken down, during the year.

Eleven hundred and ninety-five cross-arms and two hundred and fifty extensions have been placed on poles belonging to this branch and those of other companies doing business in the city.

Forty old structures have been removed from buildings, and twenty-five new ones constructed at such points as were necessary to complete the new construction and repair work herein referred to.

Seven new boxes have been added to the service by this branch, and three have been put in by the Auxiliary Company since my last report.

A nineteen-conductor aerial cable was run from City Hall to Horticultural Hall to connect the circuits destroyed by the Tremont Temple fire. Twenty-five hundred feet of ten-conductor cable have been used in short lengths in various places, chiefly for connecting apparatus in the department houses.

A submarine cable with seven conductors has been laid across the draw at Federal-st. bridge.

One hundred and thirty miles of galvanized, nineteen miles of covered iron, and fifty-five hundred feet of Clark wire have been used during the year.

A two-horse team has been added to the construction division and located in Charlestown, stalls for the accommodation of the same having been constructed in the house of Hose Company No. 3.

A storeroom and workshop has been established at 256 Dover street, and the work of the branch has been greatly facilitated thereby. Much work has been done here on stormy days, and the shop has been thoroughly equipped

with many appliances necessary for the comfort and convenience of the employees.

The dynamo service referred to as an experiment in my previous report has continued in successful operation during the year, and has now thoroughly demonstrated that its use throughout the entire system at the new headquarters will be of the greatest benefit to the service. I have recently put in two additional motor-dynamos, connecting the two new Dorchester circuits, 30 and 31, with one of them, and making use of the other for supplying current for operating the group of box-gong circuits. The full capacity of these three dynamos is in excess of the requirements of all the circuits now in service, as far as current is concerned; but I do not consider it advisable to go much further in this direction until facilities have been provided for obtaining power to run them from additional sources, and the transfer of circuits from one dynamo to another when desired. The matter is now under consideration, and it is intended that the new headquarters will be fully equipped with all the necessary appliances to accomplish this purpose.

A new combination four-dial transmitter has been put in service at the central office for operating the box-gong circuits.

It is of the most elaborate design and beautiful finish, and is capable of giving four successive combinations of four numbers each when desired. In appearance and operation it is unsurpassed by any apparatus of its kind in the country.

A set of apparatus, consisting of receiving relays, automatic repeater, testing appliances etc., has been placed in the house of Engine Company No. 9, in East Boston, and is now ready to be connected for service. This is intended to serve as an isolated fire-alarm plant to be operated independently for the protection of the district in the event of the destruction of the lines of communication between it and the central office.

The service has been unexceptionably free from damage caused by storms during the past year, there being at no time any considerable number of the circuits affected sufficiently to interfere with their successful operation.

This result may be attributed not only to the fact that severe storms have been less prevalent in this vicinity than in some previous years, but to the improved methods employed, and thorough manner of doing the work in the construction and maintenance of the system.

Respectfully submitted,

B. S. Flanders,

Inspector of Wires.

BUREAU FOR THE INSPECTION OF WIRES.

The force employed is as follows:

Inspector.
BROWN S. FLANDERS.

Deputy Inspector.
CYRUS A. GEORGE.

Assistant Deputy Inspector.
WILLIAM H. GODFREY.

INSPECTOR OF WIRES BRANCH.

Clerk.
JOHN B. SHEA.

Draughtsman.
JAMES T. BALL.

Examiners.

JAMES E. COLE,
JAMES J. DUNLEA,
JEREMIAH A. FIELD,
WALTER J. BURKE.

FIRE-ALARM BRANCH.

Operators.

CHARLES M. CHAPLIN,
UZZIEL PUTNAM,
JAMES L. CROWLEY,
JAMES L. GETHINS,
RICHARD DONAHUE,
JONA. M. MORRIS.

Assistant Operator.
WM. H. JOHNSON.

Batteryman.
JOHN B. JEFFERS.

Assistant Batteryman.
JEREMIAH E. O'BRIEN.

Foreman of Construction.
HIRAM W. CHERRINGTON.

Repairers.

G. J. H. Gutermuth,

Peter M. Kendrick,
Thomas J. Lythgoe,
Thomas C. Harrington.

Care of Clocks.

Wm. J. Reagan.

A constant watch is kept at the headquarters, City Hall, night and day, by the operators. Each set of operators have assigned to them certain hours of duty, during which time they are responsible for the correct working of the apparatus in giving alarms, and all testing of the circuits and other details pertaining to the service. No operator is permitted to sleep during his watch, unless expressly relieved by some one else, and by consent of the Inspector.

Each operator is accountable to the Inspector for any mistakes that may occur at the office during his hours of duty.

An accurate account is kept of the time of giving each alarm, and of the station from which it originates, and all other necessary information.

There are 564 fire-alarm boxes now in service.

The following boxes are private property: 38 duplicate, 115, 149, 152, 227, 228, 244, 271, 279, 281, 283, 299, 422, 442, 443, 511, 533, 617, 623, 624, 626, 629, 698, 711, 714, 715, 716, 717, 718, 719, 722, 723, 724, 725, 726, 727, 728, 729, 731, 732, 733, 734, 735, 737, 738, 739, 741, 742, 743, 744, 745, 746, 778, 779, 789, 791, 792, 793, 794, 795, 796, 797, 798, 799, 816, 838, 842, 919, 927, 974.

Stock and Fixtures.

Magnetic fire-alarm apparatus, the whole cost of which is about $161,000. Working lines of wire, about 705 miles; signal-boxes in use, 564; striking-machines, 23; gongs, 135; box gongs, 69; tappers, 11; vibrators, 5; local registers in department houses, 44; one electric watch-clock; two repeating machines for striking signals; relays in use, 74; eighteen-pen registers, 2; office bells in use, 7; telegraph keys in use, 36; main circuit annunciators, 2; local ditto, 2; fuse-boards, 2; telephones in use, 85; 2 switch-boards; 40

galvanometers; 1 fire apparatus covering map; 2 portable rheotropes; 1 typewriter; 1 chronometer; 1 telephone switch-board at headquarters; 1 ditto in chief's office; 1 set telegraphic apparatus in inspector's house; 9 sets telegraphic apparatus in assistants' houses; 2,046 battery-cups in use at central office; 50 cups dry battery in house of Engine No. 15; 50 ditto in house of Engine No. 10; 50 ditto in house of Engine No. 14; 50 ditto in house of Engine No. 23; 60 ditto in house of Engine No. 25; 80 ditto in house of Engine No. 9; 14 spare battery-cups; 203 spare porous cups; 239 spare battery-cups at shop; 300 lbs. sulphate of copper; 300 lbs. zinc; brackets, wire, insulators, etc., office furniture, bedsteads, bedding, and sundry other articles.

IN INSPECTOR'S OFFICE.

1 high-current testing-board; 1 volt-meter; 1 Am-meter; 1 mil-am-meter; 2 high resisting generators; 1 rheostat; 1 chlo. silver dry-cell battery; 1 typewriter; 1 copying-press; 1 safe.

ALARM BELLS.

The Fire-Alarm Telegraph is connected with the following bells:

Adams School-house, Sumner street, East Boston, steel, 2,995 lbs., owned by city.

Bunker Hill School-house, Charlestown, 2,009 lbs., owned by city.

Chapman School-house, Eutaw street, East Boston, steel, 3,109½ lbs., owned by city.

Chemical Engine-house No. 4, West Roxbury, owned by city, weight 1,059 lbs.

City Hall, Charlestown, composition, 3,600 lbs., owned by city.

Engine-house No. 16, Temple street, Dorchester, composition, 4,149 lbs., owned by city.

Engine-house No. 17, Meeting-House Hill, Dorchester, composition, 4,000 lbs., owned by city.

Engine-house No. 18, Harvard street, Dorchester, composition, 3,184 lbs., owned by city.

Engine-house No. 19, Mattapan, Dorchester, composition, 2,927 lbs., owned by city.

Engine-house No. 20, Walnut street, Dorchester, composition, 3,061 lbs., owned by city.

Engine-house No. 21, Boston street, Dorchester, composition, 3,026 lbs., owned by city.

Engine-house No. 28, West Roxbury, composition, 4,000 lbs., owned by city.

Engine-house No. 29, Brighton, steel, 1,535 lbs., owned by city.

Engine-house No. 30, West Roxbury, 300 lbs., owned by city.

Engine-house No. 34, Brighton, composition, 1,501 lbs., owned by city.

Engine-house No. 40, Orleans street, East Boston, composition, 817 lbs., owned by city.

Faneuil Hall, steel, 5,816 lbs., owned by city.

Lewis School-house, Dale street, Boston Highlands, composition, 3,104 lbs., owned by city.

Maverick-street Church, East Boston, composition, 2,000 lbs.

Princeton-street School-house, East Boston, composition, 2,470 lbs., owned by city.

Saratoga-street M. E. Church, East Boston, steel, 1,968 lbs., owned by city.

Warren School-house, Charlestown, composition, 3,000 lbs., owned by city.

Winthrop School-house, Charlestown, composition, 3,000 lbs., owned by city.

Bells owned by the city, which have been disconnected from service, are located as follows:

Fire-Alarm Repair-shop, bell formerly used on Phillips School-house, composition, 900 lbs.; bell formerly used on house of Chemical Engine 5; one composition, 400 lbs., formerly used on house of Chemical Engine No. 4; one composition, 400 lbs., formerly used on house of Chemical Engine No. 6; and two small bells from other locations.

Engine-house No. 1, Dorchester street, South Boston, composition, 800 lbs.

Engine-house No. 2, composition, 800 lbs.

George-street School-house, Boston Highlands, composition, 4,160 lbs.

Hook and Ladder house, No. 4, Dudley street, Boston Highlands, composition, 3,509 lbs.

Lawrence School-house, B street, South Boston, steel, 3,400 lbs.

Lincoln School-house, Broadway, South Boston, composition, 3,110 lbs.

Quincy School-house, Tyler street, composition, 2,941 lbs.

Rice School-house, Appleton street, composition, 3,042 lbs.

Smith-street School-house, Highlands, composition, 4,083 lbs.

Ticknor School-house, Dorchester street, Washington Village, steel, 2,995 lbs.

Trinity Church, Trenton street, East Boston, composition, 1,760 lbs. Formerly used on Castle-street Church.
Van Nostrand's Brewery, Charlestown, composition, 818 lbs. Formerly used on Boylston School-house.
Walpole street, Boston Highlands, composition, 2,958 lbs.
Wells School-house, Blossom street, composition, 1,675 lbs.

Public Clocks.

The following public clocks, 40 in number, are taken care of by the Fire Department.

City Proper.

Arlington-street Church.
Charles-street Church.
Christ Church, Salem street, owned by city.
